

COUNCIL OF SAN BENITO COUNTY GOVERNMENTS
TECHNICAL ADVISORY COMMITTEE

REGULAR
MEETING AGENDA

DATE: Thursday, September 3, 2026
2:00 p.m.

LOCATION: Council of San Benito County Governments
650 San Benito St., Ste. 120
Hollister, CA 95023

MEMBERS: Binu Abraham, Council of Governments
Heather Adamson, Association of Monterey Bay Area Governments
Noel Coady, California Highway Patrol
Jill Leal-Andrade, Caltrans District 5
Tony White, City of Hollister Public Works, Engineering
Cristian Builes, City of Hollister Development Services
Ashley Collick, City of San Juan Bautista
Abraham Prado, San Benito Co. RMA Planning and Building Services
Deems Katada, San Benito Co. RMA Public Works, Engineering

*Persons who wish to address the Technical Advisory Committee must address the Chairperson when public comment is called. Following recognition, persons desiring to speak are requested to state their name for the record. After hearing audience comments, the Public Comment portion of the agenda item will be closed. **The opportunity to address the Technical Advisory Committee on items of interest not appearing on the agenda will be provided during Item 4. Public Comment.***

1. **Call to Order**
2. **Roll Call**
3. **Verification of Certificate of Posting**
4. **Public Comment:** *(Opportunity to address the committee on items of interest not appearing on the agenda. No action may be taken unless provided by Govt. Code Sec. 56954.2. Speakers are limited to 3 minutes.)*
5. **Member Announcements**
 - a. City of San Juan Bautista
 - b. City of Hollister
 - c. County of San Benito
 - d. Association of Monterey Bay Area Governments
 - e. California Highway Patrol

- f. Caltrans District 5
- g. Council of Governments

CONSENT AGENDA:

(These matters shall be considered as a whole and without discussion unless a particular item is removed from the Consent Agenda. Members of the public who wish to speak on a Consent Agenda item must submit a Speaker Card to the Clerk and wait for recognition from the Chairperson. Approval of a consent item means approval as recommended on the Staff Report.)

- 6. APPROVE TAC Meeting Minutes dated June 4, 2026 – Gomez

INFORMATION ITEMS:

- 7. RECEIVE Information on Available Senate Bill 1 (SB 1) Local Partnership Program (LPP) Funds – Carpenter
- 8. RECEIVE Information on Caltrans FY 28 Sustainable Communities Planning Grant Program – Leal
- 9. RECEIVE Presentation on the Travel Behavioral Analysis for San Benito County Final Report – Abraham

ADJOURN TO REGULAR MEETING OF OCTOBER 1, 2026, AT 2:00 P.M.

In compliance with the Americans with Disabilities Act (ADA), if requested, the Agenda can be made available in appropriate alternative formats to persons with a disability. If an individual wishes to request an alternative agenda format, please contact the Clerk of the Council four (4) days prior to the meeting at (831) 637-7665. The Council of Governments Technical Advisory Committee meeting facility is accessible to persons with disabilities. If you need special assistance to participate in this meeting, please contact the Clerk of the Council's office at (831) 637-7665 at least 48 hours before the meeting to enable the Council of Governments to make reasonable arrangements to ensure accessibility.

CERTIFICATE OF POSTING

Pursuant to Government Code Section #54954.2(a) the Regular Meeting Agenda for the Council of San Benito County Governments Technical Advisory Committee on September 3, 2026, at 2:00 p.m. was posted at the following locations freely accessible to the public:

The front entrance of the San Benito County Administration Building, 481 Fourth Street, Hollister, CA 95023, and the Council of San Benito County Governments Office, 650 San Benito St., Ste. 120, Hollister, CA 95023, at the following date and time:

On the 31st day of August 2026, on or before 1:30 p.m.

The meeting agenda was also posted on the Council of San Benito County Governments website, www.sanbenitocog.org, under Meetings, TAC, 2026 Meeting Schedule.

I, Monica Gomez, swear under penalty of perjury that the foregoing is true and correct.

BY: Monica Gomez
Monica Gomez, Secretary II
Council of San Benito County Governments

COUNCIL OF SAN BENITO COUNTY GOVERNMENTS
TECHNICAL ADVISORY COMMITTEE
REGULAR MEETING

Council of San Benito County Governments
650 San Benito St., Ste. 120, Hollister, CA 95023

June 4, 2026, 2:00 PM

ACTION MINUTES

1. CALL TO ORDER:

SBCOG Executive Director Binu Abraham called the meeting to order at 2:00 p.m.

2. ROLL CALL MEMBERS PRESENT:

Binu Abraham; Council of San Benito County Governments, Regina Valentine; Alt. Association of Monterey Bay Area Governments, Capt. Noel Coady; California Highway Patrol, Jill Leal-Andrade; Caltrans District 5, Marco Martinez; Alt. City of Hollister Public Works, Engineering, Deems Katada; San Benito Co. RMA Public Works Engineering, Arielle Goodspeed; Alt. City of San Juan Bautista(arrived at 2:07 p.m.), Abraham Prado; San Benito Co, RMA Planning and Building Services(arrived at 2:09 p.m.)

MEMBERS ABSENT:

Cristian Builes; City of Hollister, Community Development.

OTHERS PRESENT:

Sgt. Robert Lehman, California Highway Patrol.

STAFF PRESENT:

Samuel Borick; Transportation Planner, Myranda Arreola; Transportation Planner, Monica Gomez; Secretary II.

3. CERTIFICATE OF POSTING

Motion made to acknowledge Certificate of Posting:

Motion: Regina Valentine Second: Noel Coady

Motion carried: 6/0

Yes: Abraham, Valentine, Coady, Leal-Andrade, Martinez, Katada

No: None

Recused: None

Abstention: None

4. PUBLIC COMMENT: None

5. MEMBER ANNOUNCEMENTS:

Jill Leal-Andrade announced that the Caltrans Sustainable Transportation Planning Grant awards had been released and that District 5 secured multiple grant awards. The San Benito County Local Transportation Authority was awarded \$199,000 to develop a Zero-Emission Bus Clean Fuel Path Strategy. Additional grants were awarded to AMBAG, MST, and SCCRTC. San Benito County also received \$174,000 for the Highway 25 Traffic Calming and Feasibility Study in the Tres Pinos area. A second feasibility study award was granted to San Luis Obispo.

There was no public comment.

CONSENT AGENDA:

6. Approve TAC Meeting Minutes dated April 2, 2026 – Gomez

There was no public comment on the Consent Agenda.

Motion made to approve the Consent Agenda:

Motion: Jill Leal-Andrade Second: Noel Coady

Motion carried: 6/0

Yes: Abraham, Valentine, Coady, Leal-Andrade, Martinez, Katada

No: None

Recused: None

Abstention: None

INFORMATION ITEMS:

7. Receive Information on Available Senate Bill 1 (SB 1) Local Partnership Program (LPP) Funds – Arreola

Myranda Arreola provided information on SB 1 Local Partnership Program (LPP) funding opportunities and responded to questions from TAC members. She noted the April 28, 2028, deadline for 2024 LPP-F (Cycle 4) project nominations and expected Fall-Winter 2026 nomination for the 2026 LPP-F (Cycle 6) and LPP-C (Cycle 5) programs. She also noted that updated guidelines for both programs are expected to be adopted this summer and may include changes to the requirements or eligibility factors from the 2024 guidelines.

There was no public comment.

8. Receive Update on the Status and Development of the 2050 Regional Transportation Plan – Borick

Samuel Borick provided an update on the Development of the 2050 Regional Transportation Plan (2050 RTP), noting that the final 2050 RTP and Environmental Impact Report (EIR) will be presented to the SBCOG Board for adoption and certification at the June 18, 2026, Board meeting.

Regina Valentine (AMBAG), on behalf of Heather Adamson, thanked TAC members for their participation in the development of the Plan and noted that the AMBAG Board of Directors is scheduled to adopt the final 2050 Metropolitan Transportation Plan/ Sustainable Communities Strategy (MTP/SCS) and certify the EIR at its June 10, 2026, Board meeting.

There was no public comment.

9. Receive Information on Caltrans Non-SHOPP Project Initiation Document 3-Year Workplan – Borick

Samuel Borick provided information on Caltrans Non-SHOPP Project Initiation Document (PID) 3-Year Workplan, which supports early coordination between Caltrans and local agencies to advance State Highway System projects and improve funding opportunities.

There was a brief discussion about potential County projects that could be considered under the workplan.

There was no public comment.

There being no further business to discuss, Jill Leal-Andrade motioned to adjourn the Technical Advisory Committee meeting at 2:25 p.m. motion seconded by Noel Coady.

Motion carried: 8/0

Yes: Abraham, Valentine, Coady, Leal-Andrade, Martinez, Katada, Goodspeed, Prado

No: None

Recused: None

Abstention: None

ADJOURN TO THE REGULAR TAC MEETING OF JULY 2, 2026, AT 2:00 P.M.

STAFF REPORT

Information

Prepared By: Matt Carpenter, Transport Strategies

Subject: Local Partnership Program (LPP)

Agenda Item No. 7

Approved By: Binu Abraham, Executive Director

Meeting Date: September 3, 2026

Recommendation:

Receive information on available Senate Bill 1 (SB 1) Local Partnership Program (LPP) Funds

Summary:

The Council of San Benito County Governments (SBCOG) is eligible to receive funds through the Local Partnership Program as the agency that administers the Measure G sales tax approved by San Benito County voters in 2018, with revenues dedicated solely to transportation. CTC announced the deadline to submit a project nomination for the 2026 LPP-C program is November 18, 2026.

Background/ Discussion:

The Local Partnership Program (LPP) was established by SB 1, also known as the Road Repair and Accountability Act of 2017, to provide funding for transportation projects that are supported by voter-approved local transportation revenues. The LPP funds are distributed through a competitive program, LPP-C, and a formulaic program, LPP-F. SBCOG's share of the LPP-F Cycle 6 funds totals \$400,000 across two fiscal years.

The LPP funding is appropriated at \$200 million annually and allocated by the California Transportation Commission (CTC) in two-year programming cycles, with new cycles programmed every two years. Of the \$200 million, \$20 million is set-aside each fiscal year for formulaic incentive funding. The remaining \$180 million is distributed annually, 60 percent via LPP-F and the remaining 40 percent via LPP-C.

The 2026 LPP program, LPP-F Cycle 6 and LPP-C Cycle 5, includes FY 2027-28 and 2028-29. The deadline to submit a project nomination for the 2026 LPP-C program, Cycle 5, is November 18, 2026. The initial project nomination deadline for the 2026 LPP-F program, Cycle 6, is expected to occur Fall-Winter 2026.

The 2026 Guidelines for the [LPP-F](#) and [LPP-C](#) programs are included [here](#). The guidelines for each program provide a list of eligible projects, including but not limited to improvements to the local road system, intelligent transportation systems, and road maintenance and rehabilitation.

STAFF REPORT

Information

Prepared By: Jill Leal, Caltrans D5

Subject: FY 28 Sustainable Communities
Planning Grant Program

Agenda Item No. 8

Approved By: Binu Abraham, Executive Director

Meeting Date: September 3, 2026

Recommendation:

Receive information on FY28 Sustainable Communities Planning Grant Program

Summary:

The California Department of Transportation (Caltrans) will award approximately \$22.4 million for Sustainable Communities and Strategic Partnerships transportation planning grants. The grant application deadline is October 9, 2026, by 5pm.

Background/ Discussion:

The California Department of Transportation (Caltrans) will award approximately \$22.4 million for Sustainable Communities and Strategic Partnerships transportation planning grants. These grants are intended to directly benefit the multimodal transportation system and strengthen the economy, promote equity, and protect the environment. The results of completed grants should lead to programmed and implemented transportation improvement projects.

The grant application deadline is October 9, 2026, by 5pm.

STAFF REPORT

Information

Prepared By: Binu Abraham

Subject: Travell Behavior Analysis Final Report

Agenda Item No. 9

Approved By: Binu Abraham, Executive Director

Meeting Date: September 3, 2026

Recommendation:

Receive presentation on the Travel Behavior Analysis for San Benito County Final Report

Summary:

The Council of San Benito County Governments (SBCOG) finalized a study to understand the travel behavior patterns in San Benito County. The study was funded by a Caltrans Rural Planning Assistance (RPA) grant.

Background/ Discussion:

The San Benito region has grown and seen a change in travel behavior since the COVID-19 pandemic, however there was a lack of dependable and detailed data to reflect post-pandemic conditions. The report addresses the limitations of existing data sources and provides a more comprehensive profile of the travel patterns within San Benito County and between adjoining counties, such as Monterey and Santa Clara. Using big data, public data, and traffic counts, the report establishes a current baseline of travel behavior and system performance.

Key findings outlined in the final report reveal considerations for near-term decisions and where further analysis is needed. The findings will help guide future transportation planning efforts undertaken by SBCOG and its three local member agencies in three key areas:

- Infrastructure and Strategic Planning
- Mobility and Transit Access
- Travel Demand Forecasting and Future Planning

The report supports an array of uses in future planning efforts, such as policy development, grant applications, and project prioritization. The technical foundation positions SBCOG and local agencies to develop countywide travel demand forecasting model and future project-level analysis.

1. Introduction

San Benito County is experiencing continued growth and increasing connections to surrounding counties, placing new demands on the transportation system. At the same time, traditional data sources remain limited in their ability to capture current travel behavior (particularly inter-county travel and post-pandemic patterns).

This report addresses these gaps by documenting how and why people travel within, to, from, and through San Benito County. It establishes a clear, data-driven understanding of existing travel behavior to support planning, policy, and investment decisions.

More broadly, the report is intended to serve as a shared foundation for understanding how the transportation system is used today, where demand is generated, and how local and regional travel patterns interact.

1.1 Analysis Purpose

The purpose of this analysis is to provide actionable insight into travel patterns and traveler characteristics across San Benito County. The findings are intended to support decision-making across three primary areas:

- **Infrastructure and Strategic Planning**
Inform corridor planning, project prioritization, and funding applications by identifying how the transportation system is used and where demand is concentrated.
- **Mobility and Transit Access**
Identify opportunities to improve access to jobs, services, and community destinations by aligning transportation strategies with observed travel behavior.
- **Travel Demand Forecasting and Future Planning**
Establish a technical foundation for the development of a countywide travel demand model and support future project- and policy-level analyses.

1.2 Report Scope

This report provides a comprehensive, data-driven assessment of travel behavior in San Benito County, including countywide and corridor-level patterns related to where, when, why, and how people travel. The analysis integrates multiple data sources (including big data platforms, public datasets, and traffic counts) to establish a current baseline of travel behavior and system performance.

The report is intended to support a range of use cases, including:

- Informing near-term corridor planning and project prioritization
- Supporting policy development and funding applications
- Providing a technical foundation for future modeling and project-level analysis

To efficiently meet these needs within a single document, the report is structured with two levels of detail:

- The main body focuses on key findings, interpretation, and planning implications relevant to decision-makers.
- The appendices provide supporting data, methodological details, and expanded results for technical users.

Because the report is designed to serve both policy and technical functions, it is more comprehensive than a summary memorandum. However, each section is organized so readers can engage at the level of detail most relevant to their needs, without requiring review of the full document.

The findings are based on modeled and observed data and are intended to characterize broad travel patterns rather than precise counts. As a result, the report supports planning and policy discussions but should not be interpreted as a substitute for project-specific analysis.

1.3 Audiences

This report is intended to support a range of users who will engage with the analysis at different levels of detail:

- **County and City Decision-Makers**
Use the report to understand key travel patterns, evaluate tradeoffs, and guide policy, funding, and investment decisions.
- **Technical Staff and Practitioners**
Use the report and appendices to access detailed data, methodology, and results that support modeling, project analysis, and implementation.
- **Partner Agencies and Stakeholders**
Use the findings to support coordination on regional travel, corridor planning, and mobility strategies that extend beyond county boundaries.

The structure of the report, combining clear, decision-focused findings with detailed technical documentation, allows each audience to access the level of information needed without requiring review of the full document.

2. Key Findings

The key findings described below establish an understanding of travel behavior in San Benito County using public data, emerging big data tools, and recent traffic counts. They support near-term planning, funding, and scoping decisions, and identify areas for future analysis.

Regional pass-through travel accounts for a large share of roadway use but is largely outside local

control: Approximately 42 percent of weekday trips interacting with San Benito County are pass-through trips that do not stop within the county, primarily traveling along key corridors such as SR 25 and SR 156. Weekend travel patterns closely resemble weekday patterns. Pass-through trips contribute substantially to congestion and VMT but are largely unaffected by local land use changes, local transit improvements, or county-level travel demand programs. As a result, purely local solutions have limited effectiveness on regionally oriented corridors. While local strategies have limited influence on pass-through volumes, they remain critical for improving local mobility, safety, and access.

Most county-generated trips are short and local, creating strong opportunities for local mobility

investments: Of the weekday trips that start and/or end in San Benito County (county trips, excluding pass-through trips), approximately 62 percent occur entirely within the county. Weekend travel patterns closely resemble weekday patterns. Intra-county trips, particularly those within Hollister, are generally short (less than 3.5 miles, on average). Intra-county trips are closely tied to daily activities; for example, 45 percent of all intra-county trips travel to or from a commercial destination, such as shops, restaurants, and personal services. Investments that improve local access, such as walking, biking, or transit connections to schools, jobs, commercial areas, and community services, are likely to benefit the greatest number of residents. Travel activity is highly concentrated in Hollister, which accounts for the majority of intra-county trips, both within the city and to and from surrounding areas.

Longer inter-county trips generate most VMT despite representing a smaller share of total trips:

Trips traveling to and from the county account for roughly 38 percent of county trips but nearly 88 percent of county-generated VMT due to their length. Travel to Santa Clara and Monterey counties is the dominant contributor. Meaningful VMT reductions will likely require strategies that address long-distance travel patterns, including regional coordination with neighboring counties, expanded inter-county travel options such as enhanced transit service and shared mobility programs, and land use strategies that bring jobs, housing, and services closer together, supported by targeted local transportation investments.

Travel demand is more distributed throughout the day and not solely driven by traditional peak-hour

commuting: While travel to work and school during traditional peak periods remains important, a large share of travel occurs throughout the day across a range of purposes, including commercial activity. Approximately 26 percent of intra-county and 41 percent of inter-county work/school trips occur outside peak periods. As a result, peak demand is less pronounced than in more commute-focused transit systems, and strategies focused solely on peak conditions will address only part of overall travel demand.

Current transit service aligns with only a small share of observed travel patterns: Existing transit services are largely structured around peak-hour commute travel, with local transit especially focused on school commute trips. Observed travel patterns indicate that a large share of observed travel

demand occurs outside these periods and is driven by non-work purposes, limiting the effectiveness of peak-only service models. More flexible, all-day mobility approaches may better align with actual demand.

Collisions are concentrated along the county's highway network, with a higher percentage of severe and fatal collisions than the statewide average: San Benito County's highways account for just over half of all injury collisions and approximately three-quarters of injury collisions involving trucks, while the remaining injury collisions are primarily concentrated in central Hollister. Collisions are often concentrated at key intersections of major roadways, most notably at SR 25 and SR 156. At this location, injury collisions have increased following construction of the roundabout, although severity appears to have decreased.

The concentration of collisions at specific locations indicates that targeted treatments at key intersections and corridor segments can have an outsized effect on improving safety outcomes countywide.

Each major corridor serves a distinct function and requires corridor-specific strategies:

- **State Route (SR) 25** primarily serves county-generated travel, with very little pass-through traffic (less than 1 percent).
- **SR 156** carries a mixture of local, regional, and freight traffic, with important differences between the two ends of the corridor.
- **US 101** largely serves regional pass-through travel, offering limited direct benefit to county residents.

One-size-fits-all solutions are unlikely to be effective given these differences.

SR 25 primarily serves county-generated travel for work, school, and other purposes such as commercial activities, with very little pass-through traffic. Capacity expansion could improve travel conditions, but it could also support additional travel demand, including non-work trips, which may contribute to higher county-generated VMT: On weekdays, about half of trips entering or exiting the county via SR 25 at the north county line are other purposes other than work and school, such as commercial activities. These trips tend to be more sensitive to travel time and convenience. As a result, expanding capacity on the SR 25 corridor is likely to increase travel demand, particularly for trips not related to work or school, which in turn would increase county-generated VMT.

Recreation and tourism travel is largely local or from adjacent counties, with targeted opportunities for improvement: Most recreation and tourism destinations attract visitors from within the county and nearby areas, particularly Hollister, southern Santa Clara County, and northern Monterey County. The recreation and tourism patterns suggest potential opportunities to improve weekend and off-peak mobility and access to key destinations, especially where recreational and commercial travel overlap.

3. Analysis Area

This chapter presents background information on San Benito County, including an overview of its geographic setting and demographics.

3.1 Geographic Setting

Located in California's Central Coast region, San Benito County encompasses nearly 1,400 square miles. The county maintains a rural character while offering a strong sense of community and historic charm.

San Benito County is bordered by Santa Clara County to the north, Monterey County and Santa Cruz County to the west, Fresno County to the south, and Merced County to the east. Major highway corridors serving the county include SR 25, SR 156, SR 129, and US 101. These state highways provide connections to the greater Monterey Bay Area, San Francisco Bay Area, and the Central Valley. The county also features key tourism destinations such as Pinnacles National Park, which attracts visitors from across the region and beyond.

Most residents are concentrated in the northern and northwestern portions of the county, which include two incorporated cities, Hollister and San Juan Bautista. Hollister has the county's highest population and serves as the primary employment center.

In addition to these incorporated cities, San Benito County also includes three unincorporated communities: Aromas, Ridgemark, and Tres Pinos.

Figure 3-1 illustrates the county boundaries, major transportation corridors, and nearby counties and cities that border San Benito County.

FIGURE 3-1

Geographic Area Map

3.2 Demographic Profile

Using existing public data sources, this section summarizes the demographic characteristics of San Benito County that influence travel patterns, including race, age distribution, household income levels, and employment characteristics, as well as work travel characteristics.

3.2.1 American Community Survey Data

The analysis incorporates American Community Survey (ACS) data from the U.S. Census Bureau to provide demographic context and to complement big data sources, especially for commuting trips. ACS is an annual survey of a randomly selected sample of households nationwide. Additional details on the public data sources used in this analysis are provided in **Section 4.1** below.

Data limitations: While ACS provides more detailed responses than the decennial census, it reflects only the subset households that responded to the survey. In addition, ACS only captures work-related travel. Despite these limitations, it remains a reliable source for information on income, employment by industry, and vehicle availability.

3.2.2 Existing Demographics

The demographic profile of San Benito County indicates a community with a significant proportion of children and older adults, an economy rooted in production and services, and strong reliance on car travel.

Based on 2019–2023 ACS data, San Benito County has an estimated population of 66,100, which is slightly higher than the estimate of 65,700 for 2023 reported in the Association of Monterey Bay Area Governments (AMBAG) 2026 Regional Growth Forecast (September 2024). Hispanic or Latino residents make up the largest share of the San Benito County’s population, followed by White residents. The age distribution is anchored by two significant groups: those 17 years or younger and adults between 45 and 65 years old. Detailed demographic data are stored in **Appendix A**.

Figure 3–2 shows the percentage of the County employed population aged 16 years or older, by income and industry. According to the 2019–2023 ACS data, the median household income is approximately \$108,000 and the mean income is approximately \$138,000. Over one-third of the employed population aged 16 years or older falls within the lower-income category (below 80 percent of the Area Median Income). Based on 2024 ACS data, 7.2% of the county’s total population is considered to be at or below the federal poverty line.

Among the employed population aged 16 and older (approximately 31,000 people), the unemployment rate was around 6 percent as of 2023. While the largest share of county employees work in educational services, health care, and social assistance (19 percent), this is slightly lower than the statewide average for this industry. Instead, San Benito County is higher than the statewide average for employment in industries like construction, manufacturing, wholesale trade, and, especially, agriculture; these industries together account for about 32 percent of all employment for county residents. The county is also below the statewide average in industries such as finance, insurance, real estate, and information, which comprise less than 5 percent of employment for county residents.

San Benito County’s employment profile could indicate a reliance on automobiles, as many jobs in agriculture, construction, and manufacturing are located in dispersed or rural areas that are not well

served by walk, bike, or transit modes of transportation, or that require the delivery of goods using vehicles. Together with the relatively small share of employment in information, finance, and professional services, industries that are typically more conducive to remote work, this could indicate fewer opportunities for telecommuting, thereby increasing the need for traveling to work on a daily basis.

Percentage of Employed Population 16 Years or Older by Industry

Percentage of Population by Income Level

FIGURE 3-2

Demographic Profile (American Community Survey)

3.2.3 Work Travel Characteristics

Figure 3-3 illustrates the county residents' key travel to work characteristics. Based on 2019–2023 ACS data, 75 percent of county residents drive alone to their jobs. Driving is the dominant mode of travel in a county where nearly 60 percent of employed residents have access to three or more cars. Only about 9 percent of residents work from home, while about 50 percent leave the county for work, well above the 15 percent average statewide.

Nearly a quarter of workers travel 60 minutes or more to their work, roughly twice the statewide average of 12 percent. On the other hand, about 15 percent of workers travel less than 10 minutes to their work, also higher than the statewide average of 10 percent. A 10-minute travel to work time represents travel to local jobs, likely within the Hollister area; the small size of San Benito County communities means that those who work locally can get to their jobs quickly and easily. On the other hand, a 60-minute travel to work time corresponds roughly with the time to drive to major employment centers in Santa Clara County, as well as the Santa Cruz or Monterey areas. The lack of nearby population centers means that roughly half of employed residents who leave the county for work must travel a long distance to access jobs.

Based on the California National Household Travel Survey Add-On (accessed May 2026), calibrated for rural county characteristics, travel to work trips account for roughly 16 to 18 percent of daily travel statewide and approximately 18 to 22 percent in San Benito County. Home-based, non-work trips represent the majority of daily trips (roughly 60 percent), while non-home-based trips account for the remaining 15 to 20 percent of travel.

San Benito County's rural land use pattern and limited local employment base result in a slightly higher proportion of the employed population traveling to work and a modest reduction in non-work and non-home-based trips¹ relative to statewide averages. This aligns with patterns in National and California household travel survey data, which indicate that rural residents make fewer total daily trips, with commuting accounting for a greater share of overall travel and fewer discretionary and inter-activity trips occurring throughout the day.

¹ Home-based trips have either an origin or destination at home, while non-home-based trips occur entirely between non-home locations. Similarly, work-based trips include a work trip end, while non-work-based trips do not.

4. Data Collection

This chapter describes the data sources and data collection methods used in the Travel Behavior Analysis for San Benito County. The analysis used multiple complementary data sources to establish a current, comprehensive understanding of travel behavior, including public data, big data platforms, and field-collected traffic counts.

4.1 Existing Public Data

Existing public data received from SBCOG was used to develop the demographic profile of the analysis area and to provide context and validation for other data sources. These public datasets established a baseline understanding of population, employment, and travel conditions and support interpretation of observed travel behavior.

Public data presented in this report includes demographic information from the American Community Survey 2019–2023 5-year data and the AMBAG 2026 Regional Growth Forecast (September 2024) and transit ridership data from San Benito County Local Transportation Authority (LTA).

4.2 Big Data

Big data sources, Replica and Azira, helped provide detailed insights into origin–destination patterns, trip purpose, travel distances and timing, mode share, and traveler characteristics. Together, Replica and Azira datasets supported a multi-level analysis of travel behavior at the countywide, corridor, and trip type-scales.

Azira samples real activity captured through location pings from mobile devices, which is then extrapolated to represent broader travel behavior. Replica, by contrast, is a travel demand model that includes all individuals and most travel within the county and is calibrated using real-world activity data. Used together, these big data sources combine modeled estimates with samples of observed behavior to provide a robust picture of travel patterns.

4.2.1 Replica Data

Replica is a nationwide, activity-based travel demand model that incorporates a wide range of data sources to model activities and travel behavior. Data sources include census data, travel surveys, location-based information, and consumer activity data. Replica is validated against traffic counts, transit ridership, and other publicly available observed data.

Replica is updated twice a year. This project used the Spring 2025 model, which was the most recent model available at the time of analysis. Compared with traditional travel models, Replica offers advantages in geographic coverage, update frequency, and ease of use. The platform provides access to aggregate travel patterns, including mode choice, trip purposes, VMT, and more through an online platform.

Data limitations: While Replica offers benefits relative to traditional travel models, it remains limited by the availability and quality of input data and the inherent unpredictability of travel patterns. This is true of any travel model, including the AMBAG travel model. Consequently, Replica will not perfectly

match real-world conditions, especially on lower volume roads and in localized areas. Replica is appropriate for general assessments of travel behavior at larger scales (like county level travel) and complements more traditional approaches like traffic counts and census or survey data, which are limited by their sample size.

For this analysis, Replica outputs representing an average weekday (Thursday) and an average weekend day (Saturday) for Spring 2025 were collected to support the analysis of countywide travel behavior and corridor-specific travel behavior. Processed Replica outputs for the countywide and corridor-specific travel behavior analyses are included in **Appendix B** and **Appendix C** for transparency and future use.

4.2.2 Azira Data

Azira provides human movement data primarily derived from smartphones. Location-based information documents the trajectories of sampled trips during defined analysis periods, allowing analysis of travel patterns before and after travelers are observed at specific locations.

Azira is used for questions that are difficult for Replica to address. Replica models travel behavior at the census block group level, which limits its ability to identify specific activity locations such as recreational and tourism destinations, which are important travel markets in San Benito County. Azira data is mainly used to analyze recreational and tourism travel patterns, as discussed in **Chapter 7**. Azira data for individual trips traveling to key recreational and tourism destinations in San Benito County were collected for the year 2025.

Data limitations: Azira typically captures only 5 to 15 percent of all observed trips, and the percentage captured may be even lower in areas with poor cell-phone reception. While Azira does not represent all trips, it can still provide useful insight into typical origins of trips to specific destinations.

The Azira data used in the recreational and tourism travel behavior analysis are processed and presented through a series of dot distribution maps that illustrate the common evening locations of trips to each key destination and are included in **Appendix D** for transparency and future use.

4.3 Traffic Count Data

Traffic counts are real-world observations that measure current traffic volumes by time period and location and serve as a control for validating and refining results from other data sources. Two types of traffic counts were collected for this analysis. Traffic count locations, a comparison summary of observed traffic counts versus Replica estimates, and the raw traffic count data are included in **Appendix E** for transparency and future use.

4.3.1 Classification Counts

20 locations were surveyed using 24-hour segment tube counts on five days (Tuesday, Wednesday, Thursday, Saturday, and Sunday) between March 3 and March 15, 2026. Counts include both passenger and commercial vehicles.

4.3.2 Mode Share Counts

Peak period (7 to 11 AM and 3 to 7 PM) counts were collected on a weekday day and weekend day at 5 locations between March 3 and March 15, 2026. Counts classified the following:

- Single-occupant vehicles
- Carpools by occupancy (2, 3, 4+ persons)
- Transportation network company vehicles (e.g., Uber, Lyft) by occupancy
- Trucks
- Transit vehicles
- Bicyclists
- Pedestrians
- Scooters, and other micro-mobility modes

5. Countywide Travel Behavior

This chapter provides a countywide overview of observed travel behavior in San Benito County. The analysis examines trip types, origins and destinations, time of day patterns, trip purpose, and travel mode to establish a clear baseline of how the transportation system is used today.

Understanding these countywide patterns is essential for identifying which trips place the greatest demand on roadways and which travel markets offer realistic opportunities for mode shift. The findings also provide a shared foundation for the corridor-specific analyses that follow.

All trips discussed in this chapter represent person trips, not vehicle trips, except where noted in the VMT section (Section 5.2). Processed Replica data for the countywide travel behavior analyses, stored in data-table format, are included in **Appendix B** for transparency and future use.

5.1 What Types of Trips Interact with the County?

The first step in understanding countywide travel behavior is to distinguish which types of trips occur in San Benito County and how those trips relate to local and regional travel demand.

This section categorizes trips based on whether they begin and/or end within the county or simply pass through the county. Separating county-generated travel from pass-through travel is critical for understanding congestion, VMT, and mobility challenges. The trip types defined below provide a framework used throughout this chapter and in subsequent analyses. They establish the foundation for evaluating trip distribution, trip length and VMT, origin-destination patterns, time of day characteristics, trip purpose, and mode choice.

- **Pass-through trips:** Trips that do not start or end in San Benito County, but travel through the county without stopping.
- **County trips:** Trips that start and/or end in San Benito County (intra-county and inter-county trips combined)
 - **Intra-county trips:** Trips that start and end in the county.
 - **Inter-county inbound trips:** Trips that travel from locations outside the county to the county.
 - **Inter-county outbound trips:** Trips that travel from the county to locations outside the county.

5.1.1 What Percentage of All Trips are Pass-Through Trips?

Pass-through trips play an important role in travel associated with San Benito County. As shown on the distribution of all trips interacting with the county (left pie chart) in **Figure 5-1**, **approximately 42 percent of weekday trips interacting with the county are trips that pass through the county without stopping, while 58 percent are trips that start and/or end in the county (county trips).**

This indicates that a large share of roadway activity is driven by regional travel moving through the county rather than local travel needs. In other words, nearly half of the traffic using the county's roadway network is not tied to local residents, jobs, or services. This pattern helps explain why some corridors (particularly those connected to US 101 and SR 156) experience volumes that may not align with local land use or population patterns.

Why this matters to understand the system:

- Pass-through travel increases congestion and VMT within the county but is not directly influenced by local land use or transportation policies.
- County-level decisions alone are unlikely to meaningfully change these travel patterns.
- Separating pass-through from county-generated travel is therefore essential for identifying where local strategies can be effective.

To focus on travel behavior that local agencies can influence, the remaining sections of this chapter emphasize trips that start or end within San Benito County. Additional discussion of pass-through travel (particularly along the SR 156 and US 101 corridors) is provided in **Chapter 6**.

Distribution of All Trips
Interacting with the County

Distribution of
County Trips

FIGURE 5-1

Weekday County Trip Distribution

5.1.2 What is the County Trip Distribution?

After distinguishing pass-through trips from county-generated trips, the next step is to examine how county trips are distributed between trips that occur within the county and those that travel to and from the county.

As described in the previous sub-section, 58% of all trips interacting with the county are trips that start and/or end in the county (county trips). **Of these county trips, about 62 percent occur fully within the county, while the remaining 38 percent travel to or from the county**, as shown in the distribution of county trips (right pie chart) in **Figure 5-2**. There is an even split between trips leaving the county and those entering it.

Most trips to and from the county enter or exit through major highway corridors in the northern part of the county, including SR 25, SR 156, SR 129, and US 101. As shown in **Figure 5-2**:

- About 52 percent of trips enter or exit the county via SR 25 at the north county line
- About 38 percent of trips use SR 156, connecting to US 101 or SR 129 at the northwest county line, or US 101 at the west county line.
- The remaining 10 percent of trips use SR 156 to enter or exit the county via the north county line.

Note that a small share of inter-county trips also enter or exit the county via SR 25 at the southern county line, as well as other local roadways along the county line; they are excluded from the discussion above because they represent a very small percentage of total trips. Additional details on travel characteristics associated with major highway corridors are discussed in **Chapter 6**.

This distribution shows that while regional travel (inter-county trips) is highly visible and important (especially for VMT) most daily trips made by county residents are local and occur entirely within San Benito County.

At the same time, the concentration of inter-county travel at the north county line indicates that regional connectivity relies on a small number of highway corridors.

Why this matters for understanding travel behavior:

- Local travel dominates trip frequency, meaning most daily movement relates to nearby destinations such as schools, shops, and services.
- Inter-county travel plays a disproportionately large role in regional connectivity and corridor demand, even though it represents a smaller share of trips.
- The spatial concentration of inter-county trips suggests that corridor performance and bottlenecks are driven by both local and regional travel interacting in the same locations.

FIGURE 5-2

Weekday Trip Distribution via Highway Corridors

5.1.3 Policy and Planning Implications

The distinction between pass-through and county-generated travel has important implications for how transportation challenges are understood and addressed.

A substantial portion of roadway demand in San Benito County is driven by pass-through travel that is largely outside local control. Because these trips are shaped by regional travel patterns, strategies such as local land use changes, local transit improvements, or county-level demand management programs will have limited influence on these volumes. This is particularly relevant for corridors that primarily serve regional travel.

In contrast, intra-county trips represent the majority of daily travel activity and are closely tied to local destinations and needs. These trips are typically short and occur throughout the day, creating meaningful opportunities for:

- Walking and bicycling improvements
- Local transit service enhancements
- Improved access to schools, jobs, and commercial areas

Inter-county trips, while fewer in number, highlight the importance of **regional coordination**, particularly along key highway corridors. These trips connect residents to jobs and services outside the county and contribute significantly to corridor demand and system performance.

Taken together, these patterns indicate that:

- Local mobility investments will be most effective at improving access and quality of life for residents.
- Regional coordination will be necessary to address congestion and travel demand on major corridors.
- A one-size-fits-all approach is unlikely to be effective, given the different roles played by pass-through, intra-county, and inter-county travel.

5.2 What Trip Lengths and VMT Patterns Characterize County Travel?

After distinguishing which types of trips interact with San Benito County, the next step is to understand how far those trips travel and how much VMT they generate. Trip length provides critical context for evaluating transportation impacts, identifying realistic opportunities for mode shift, and understanding which travel markets drive overall system demand.

This section examines trip length and VMT by trip type to distinguish between short local travel and longer inter-county and regional travel. **Note that while all other sections address person trips, this section (Section 5.2) analyzes vehicle trips.** While many trips occur within the county, longer trips to and from surrounding areas account for a disproportionate share of VMT. Understanding this relationship is essential for interpreting congestion, evaluating VMT mitigation strategies, and aligning transportation and land-use policies with the sources of greatest system impact.

5.2.1 How Do Different Trip Types Contribute to VMT?

Trips that travel to and from the county account for about 38 percent of all county trips but nearly 88 percent of the county-generated VMT, demonstrating that these trips are much longer than those within the county. Vehicle trips within the county average 3 to 4 miles, while trips traveling to and from the county average 30 to 40 miles.

Figure 5-3 shows the travel shed map, illustrating the locations travelers can reach within specific travel lengths and providing a visual understanding of typical trip distances associated with county travel. Based on the private vehicle travel shed from Hollister, an average trip length of 3 to 4 miles for intra-county travel suggests that a large portion of trips both start and end within Hollister. An average trip length of 30 to 40 miles for inter-county travel suggests that many trips occur between Hollister and the southern part of Santa Clara County as well as the northern part of Monterey County. **Section 5.3** provides detailed information on origin–destination flows for both inter-county and intra-county travel.

FIGURE 5-3

Private Vehicle Travel Shed from Hollister

These findings show a clear disconnect between how often trips occur and how much impact they have on the system. While most trips are short and local, system-wide impacts (especially VMT) are overwhelmingly driven by longer-distance inter-county travel.

This pattern reflects San Benito County's role within the broader region:

- Residents frequently travel outside the county for jobs, services, and opportunities.
- These trips are relatively infrequent compared to local trips, but much longer in distance.

The travel shed analysis further illustrates that:

- Short trip lengths are concentrated within Hollister and nearby areas.
- Longer trips extend to southern Santa Clara County and northern Monterey County.

This reinforces that regional connections (not just local circulation) drive system-level impacts.

Looking at all trips interacting with the county (including pass-through trips), only about 14 percent of total VMT² is generated by county trips, with the remaining VMT primarily associated with pass-through travel.

This indicates that a substantial share of VMT on the county's roadway network is driven by travel that neither starts nor ends in the county. As a result, total system impacts are shaped not only by resident behavior, but also by regional travel patterns outside local control.

Why this matters for understanding travel behavior:

- Trip frequency alone does not indicate system impact (trip length is the dominant driver of VMT).
- Strategies focused only on local trips may improve mobility and access, but will have limited influence on overall VMT.
- Regional travel patterns play a defining role in shaping transportation system performance in the county.

² Total VMT estimates reflect the full length of all trips associated with the county, rather than only the portion occurring within the county.

5.2.2 Policy and Planning Implications

Trip length and VMT patterns demonstrate that **long-distance inter-county travel is the primary driver of VMT in San Benito County**, even though these trips represent a smaller share of total trips. In other words, **policies and investments focused solely on short, local trips (while valuable for safety, access, and equity) are unlikely to achieve substantial VMT reduction on their own.**

This has important implications for transportation planning, particularly under environmental analysis, where VMT is the primary metric for environmental impact.

Policies and investments focused on short, local trips (such as improvements to walking, bicycling, or local transit) can deliver important benefits, including:

- Improved mobility and access
- Increased transportation options
- Safety improvements
- Equity benefits

However, these strategies alone are unlikely to result in substantial reductions in total VMT, because they do not address the longer trips that generate the majority of system-wide travel distance.

Meaningful VMT reduction will require a broader, multi-faceted approach that includes:

- Regional coordination with neighboring counties
- Improved inter-county travel options, including transit and shared mobility
- Land use strategies that reduce the need for residents to travel long distances for jobs and services

At the same time, intra-county trips remain an important focus for local planning. Although they contribute relatively little to total VMT, they represent the majority of daily travel activity and offer the greatest opportunity for mode shift and local mobility improvements.

Taken together, these patterns highlight a dual strategy:

- Local investments to improve everyday mobility, safety, and access
- Regional strategies to address the primary drivers of VMT and system-level impacts

5.3 Where Are People Traveling To and From?

After understanding how trip length and VMT are distributed across trip types, the next step is to examine where trips begin and end. Origin–destination patterns provide critical insight into who the transportation system primarily serves and how travel demand connects San Benito County to surrounding areas.

This section examines countywide origin–destination flows to distinguish between trips that remain within the county and those that connect to nearby cities and counties. Understanding these patterns helps clarify whether travel demand is primarily generated by county residents, visitors, or regional commuters, and where targeted mobility and land–use strategies are most likely to benefit local communities. **This section (Section 5.3) and subsequent sections analyze all person trips, not just vehicle trips.**

The findings in this section provide important context for prioritizing investments, coordinating with neighboring jurisdictions, and interpreting the corridor–specific analyses presented in the following chapter.

5.3.1 What Does Travel Look Like Inside the County?

For this analysis, San Benito County is divided into four geographic areas: Hollister, San Juan Bautista, Unincorporated North, and Unincorporated South. **Appendix B** includes a map showing the four geographic areas.

Table 5–1 summarizes intra-county origin–destination flow patterns associated with Hollister, showing the percentage of trip movements between each geographic area and Hollister.

As shown in **Table 5–1**, **Hollister is the highest trip generator in San Benito County, with travel to, from, and within Hollister accounting for approximately 86 percent of all intra-county trips.**

Table 5–1: Intra-County Origin–Destination Flow Pattern Associated with Hollister

Origin	Destination	Percent of Weekday Intra-County Trips
Hollister	San Juan Bautista	1%
Hollister	Unincorporated South	2%
Hollister	Unincorporated North	12%
Hollister	Hollister	55%
Unincorporated North	Hollister	13%
Unincorporated South	Hollister	2%
San Juan Bautista	Hollister	1%

Source: Replica, Fehr & Peers, 2026.

As shown in **Table 5–1**, about 55 percent of all internal county trips have both their origin and destination within Hollister. The Unincorporated North area is the second-highest generator of internal trips, with substantial travel between this area and Hollister (12 percent of trips from Hollister

to Unincorporated North and 13 percent from Unincorporated North to Hollister. Unincorporated North also has a significant share of internal trips with both their origin and destination within the area (11 percent).

These patterns indicate that travel activity is highly concentrated in Hollister, reflecting its role as the county's primary center for employment, services, and daily activities. The large share of trips occurring entirely within Hollister suggests that many residents are able to meet daily needs locally.

At the same time, the strong connection between Hollister and the Unincorporated North area shows that local travel extends beyond city boundaries, linking nearby residential and employment areas to the county's primary activity center.

Why this matters for understanding travel behavior:

- The concentration of trips within Hollister indicates that local accessibility; rather than, long-distance travel is the dominant daily travel need.
- Travel patterns suggest a hub-and-spoke structure, with Hollister serving as the central hub for surrounding areas.
- Improvements within Hollister and along connections to nearby communities are likely to benefit the largest share of users.

5.3.1.1 Opportunities for Active Transportation

These origin–destination patterns highlight a clear opportunity to expand active transportation within the county. As described in **Section 5.2**, most intra-county trips are short (approximately 3 to 4 miles on average), and a substantial share occurs within Hollister, the county's primary activity center.

The combination of short trip distances and concentrated travel activity suggests that many of these trips could be accommodated by walking or bicycling where safe and connected infrastructure is available. In particular, trips between residential areas and key destinations—such as commercial areas, schools, and community services within and near Hollister—represent the most viable opportunities for mode shift.

This pattern is consistent with the opportunity areas identified in the AMBAG Sustainable Communities Strategy/Metropolitan Transportation Plan (SCS/MTP), including areas in western Hollister (between Santa Ana Road and Tres Pinos Road) that reflect higher-density infill development. Additional opportunity areas are identified in San Juan Bautista, including locations on both sides of SR 156 (SJB-1 and SJB-2), which are associated with town-center development patterns.

This analysis also draws on AMBAG's 2045 and 2050 MTP/SCS growth opportunity mapping, including the Hollister (HO) and San Juan Bautista (SJB) typologies presented in Appendix I of the 2045 MTP (pages 21 and 26). These maps identify high-density infill corridors and town-center areas that align local General Plans with regional sustainability goals and provide a useful framework for identifying corridors with the greatest potential to support increased walking and bicycling.

Together, these findings indicate that targeted investments in walking and bicycling infrastructure within Hollister and San Juan Bautista could support a meaningful share of daily trips, improving local accessibility while advancing broader mobility and safety goals, and potentially supporting increased transit use.

5.3.2 What Does Travel Look Like Between the County and Surrounding Areas?

Travel between San Benito County and surrounding areas is dominated by a small number of nearby destinations.

Specifically, **Table 5–2** identifies top travel destinations outside the county and shows the percentage of weekday trips from San Benito County to each destination. The nearby areas consist of sub-county geographies centered around cities in adjacent counties that experience the highest concentration of trips to and from San Benito County. The remaining counties represent broader surrounding regions where substantial travel activity still intersects with San Benito County, though at lower levels than the nearby areas.

The most significant include:

- Gilroy (27 percent of inter-county trips)
- Salinas/Northern Monterey County (19 percent)
- Other destinations such as Morgan Hill and Watsonville at lower shares

The remaining inter-county trips are distributed across broader areas of Santa Clara, Monterey, and other counties.

Table 5–2: Percentage of Weekday Inter-County Trips to Top Destinations Outside the County

Destination	Percent of Weekday Inter-County Trips
<i>Nearby Areas</i>	
Gilroy	27%
Salinas/Northern Monterey County Cities	19%
Morgan Hill	6%
Watsonville	6%
<i>Other Counties</i>	
Rest of Santa Clara County	17%
Rest of Monterey County	8%
Merced County	6%
Rest of Santa Cruz County	3%

Notes: About 8 percent trips travel to other areas within California and outside of California.
Source: Replica, Fehr & Peers, 2026.

Figure 5–4 to Figure 5–6 summarize inter-county origin–destination flow patterns, illustrating the percentages of inbound and outbound trip movements from each geographic area within San Benito County to geographic areas outside the county, excluding Unincorporated South. Only about 4 to 5 percent of inter-county trips interact with the Unincorporated South area.

Santa Clara County, specifically the City of Gilroy, is the most popular destination for trips from Hollister. For trips from San Juan Bautista and Unincorporated North, Gilroy and Salinas/North

Monterey County are the most popular destinations. Gilroy is also the most popular destination for trips from Unincorporated South. Travel patterns are similar on weekends.

These patterns show that inter-county travel is not evenly distributed across the region, but instead concentrated in a few key nearby cities, particularly in southern Santa Clara County and northern Monterey County.

This reflects strong economic and social connections between San Benito County and these nearby areas, including access to jobs, services, and commercial destinations.

Differences across geographic areas within the county also suggest that:

- Residents of some areas (e.g., San Juan Bautista and Unincorporated North) have stronger connections to Monterey County.
- Other areas (particularly Hollister) are more tied to Santa Clara County destinations such as Gilroy.

Why this matters for understanding travel behavior:

- Inter-county travel reflects structured regional relationships, not random or evenly distributed movement.
- These patterns suggest that residents rely on a small number of external destinations for key needs, particularly employment and commercial services.
- Transportation demand is therefore focused along specific corridors connecting to these destinations, consistent with findings from the previous section showing that most travel into and out of the county occurs via SR 25 or SR 156.
- Regional coordination to address congestion and travel demand on these major highway corridors would enhance county residents' access to jobs, services, and commercial destinations.

*7% of trips travel from other areas within California and less than 1% travel from other areas outside of California

FIGURE 5-6

Weekday Inter-County Travel to and from Unincorporated North San Benito County

5.3.3 What Are the Home Locations of County Trips?

About 70 percent of weekday inter-county trips traveling to or from San Benito County are made by people who live in the county; of those trips, about 63 percent originate in Hollister. Among inter-county trips made by people with homes outside the county, roughly 37 percent come from Monterey County and about 35 percent come from Santa Clara County. Travel patterns are similar on weekends.

These findings indicate that even for inter-county travel, the system primarily serves county residents rather than external visitors or commuters. While there is inbound travel from surrounding counties, the majority of demand reflects residents traveling outward, reinforcing the idea that San Benito County functions more as a trip origin than a regional destination.

Why this matters for understanding travel behavior:

- Transportation demand is largely shaped by the needs of local residents traveling to nearby regional destinations.
- External travel into the county exists but plays a secondary role compared to outbound travel by residents.
- Planning strategies should focus on how residents use the system, rather than assuming travel demand is driven by outside users.

5.3.4 Policy and Planning Implications

Origin–destination patterns show that San Benito County’s transportation system is primarily used to support the daily travel needs of its residents, both within the county and to nearby regional destinations.

The strong concentration of intra-county travel—particularly within Hollister—indicates that local mobility improvements will provide the greatest direct benefit to residents. Investments in walking, bicycling, and local transit, especially in and around Hollister, can improve access to jobs, services, and community destinations where the majority of trips occur.

At the same time, consistent inter-county travel connections to cities such as Gilroy and Salinas highlight the importance of regional connectivity. These destinations serve as key hubs for employment and services, and travel demand is concentrated along corridors that connect San Benito County to these areas.

These patterns suggest that effective transportation strategies should:

- Prioritize local access improvements in high-activity areas, particularly Hollister
- Support targeted corridor improvements that reflect dominant inter-county travel paths
- Recognize that San Benito County primarily functions as a trip origin, with residents traveling outward to meet many daily needs

Taken together, the findings reinforce the need for a balanced approach that improves local accessibility while strengthening connections to nearby regional destinations, where a significant share of economic and social activity occurs.

5.4 When Do Trips Occur?

After examining where trips originate and where they are destined, the next step is to understand when those trips occur. Time of day travel patterns provide important context for evaluating congestion, transit feasibility, and the effectiveness of operational and service-based strategies.

This section examines how travel demand varies throughout the day and across weekdays and weekends for trips interacting with San Benito County. Understanding the distribution of travel by time period helps clarify whether demand is concentrated within traditional peak hours or spread more evenly throughout the day, and it provides a critical foundation for interpreting later findings related to trip purpose and mode choice.

5.4.1 What Are the Variations in Travel Patterns by Time of Day on Weekdays and Weekends?

Time-of-day patterns in San Benito County show relatively modest variation across the day, with travel occurring consistently throughout both weekdays and weekends.

For intra-county travel:

- The PM period (2 to 4 PM) represents the highest share of trips.
- The AM period (6 to 10 AM) and midday period (10 AM to 2 PM) have comparable shares, with only slightly lower activity.
- Evening and overnight periods show expected declines, but not sharp drops.

For inter-county travel:

- The PM period remains the largest share (about 29 percent), followed by midday and AM periods.
- Weekday and weekend patterns are broadly similar.

Figure 5-7 shows daily peaking characteristics and trip type distribution by time of day for average weekday and weekend. Note that the distributions shown in the figure are based on person trips, and that the percent distribution of all trips by time of day includes pass-through trips; however, the percent distribution of inter-county and intra-county trips by time of day excludes pass-through trips. Relatively high midday travel levels and higher PM than AM travel of both inter-county and intra-county travel indicate that a significant share of trips are made for purposes other than work and school, such as commercial, social, or recreational activities. Details on trip purpose by time of day are discussed in **Section 5.5**.

These patterns indicate that travel demand in San Benito County is not only concentrated in traditional peak commute periods, defined as weekday AM and PM periods with typically high concentrations of travel to work or school. Instead, travel is distributed across the day, with relatively high activity during midday and PM periods.

This differs from expectations in more urbanized or job-centered regions, where travel is typically dominated by sharp AM and PM commute peaks. In San Benito County:

- The midday period captures a significant share of trips, suggesting that many trips are made for non-work/non-school purposes (such as commercial, social, and recreational trips) or for work or school related travel occurring outside traditional peak commute periods.
- The PM peak is more pronounced than the AM peak, further indicating that travel is not driven solely by traditional commute patterns.

Importantly, this does not mean that work or school travel is absent or unimportant. Rather, it indicates that traveling to work or school during traditional commute peak periods is one of several contributors to overall demand, and that its signature is less dominant when viewed at the countywide level alongside other trip purposes.

Why this matters for understanding travel behavior:

- Travel demand reflects a mix of trip purposes, not just travel to work or school during the traditional peak commute period.
- Countywide patterns may mask stronger commute peaks on specific corridors, particularly those serving inter-county travel.
- Evaluating only peak-hour conditions may overlook a large share of daily travel activity.

FIGURE 5-7

Time of Day Distribution by Trip Types

5.4.2 Policy and Planning Implications

Travel in San Benito County is not heavily concentrated within traditional commute peaks. Trips occur throughout the day on both weekdays and weekends, with similar distributions across trip types and relatively modest variation by time period.

The travel patterns by time of day suggest that transportation strategies focused primarily on traditional peak commute conditions (such as AM and PM peak-only transit service or peak-period roadway investments) will address only a portion of overall travel demand. Services and infrastructure designed to operate effectively throughout the day are more likely to align with observed travel behavior and provide broader mobility benefits.

Instead, the findings suggest that:

- All-day mobility strategies are more closely aligned with observed travel behavior.
- Transportation systems should support travel across a wide range of times and trip purposes, including commercial, social, and recreational trips.
- Service reliability and accessibility throughout the day may be as important as peak-period capacity.

These patterns also reinforce the importance of aligning transportation investments with trip purpose:

- Strategies focused on traditional peak commute periods are important, but not sufficient on their own.
- Improvements that support non-work travel—such as access to shopping, services, and community destinations—will benefit as many, if not more, daily trips.

At the same time, it is important to recognize that countywide averages may mask corridor-level differences. Certain corridors, particularly those connecting to Santa Clara County, may exhibit stronger peak-period travel associated with commuting. As a result, a balanced approach is needed:

- Corridor-specific strategies to address traditional peak commute congestion where it occurs.
- System-wide strategies that support consistent travel demand throughout the day.

Taken together, these findings highlight the need for a transportation system that is designed not only for peak commuting, but for flexible, all-day travel that reflects how people actually move within and beyond San Benito County.

5.5 Why Do People Travel?

After examining when trips occur throughout the day, the next step in the countywide travel behavior analysis is to understand why people are traveling. Trip purpose provides critical context for interpreting time of day patterns, evaluating mode choice, and identifying which policy and planning strategies are most likely to influence travel behavior.

This section examines the purpose of trips interacting with San Benito County, distinguishing between intra-county and inter-county travel, and summarizing how different trip purposes vary by time of day and day of week. Understanding whether travel is driven primarily by work, school, commercial, recreational, or other activities helps clarify the underlying forces shaping travel demand and informs the role of land-use, mobility, and transit strategies in addressing that demand.

Each trip purpose category is defined below.

- **Recreation** – Trips to or from destinations such as parks, golf courses, gyms, movies, sports facilities, or other leisure activities.
- **Commercial** – Trips to or from shops, restaurants, personal services, and other commercial establishments.
- **Social** – Trips made to visit another person's home.
- **School** – Trips between home and school.
- **Work** – Trips between home and the workplace.
- **Freight** – Trips made by medium to heavy trucks for deliveries and other commercial freight-related purposes.
- **Other** – All other trips that do not fall into the categories above.

Sometimes trips include more than one purpose. The list of purposes above is in descending order, based on a defined hierarchy, to help categorize these multipurpose trips. For example, a shop-to-work trip, meaning a trip with an origin at a commercial location and a destination at a work location, is categorized as Commercial rather than Work, because Commercial is higher in the hierarchy. Freight trips do not overlap with any other trip type.

Another way of categorizing multipurpose trips is to look at them in the context of a chain of trips.

- **Work/School Trip Chain** – Trip chains between a person's home and their work or school, including any intermediate stops at other destinations.
- **Non-Work/Non-School Trip Chain** – Trip chains that are not between a person's home and work or school, such as dedicated trips for commercial, recreational, or social purposes.
- **Freight/Other Trip Chain** – Remaining trip chains, primarily those for business-related freight travel, but also including other trips that do not fall into the categories above.

This analysis will look at trip purpose through the lens of both the trip purpose categories, which emphasize the immediate purpose of a trip, and the trip chains, which contextualize a trip within a person's daily travel.

5.5.1 What is the Travel Purpose for Intra-County Trips?

Figure 5-8 presents charts showing the percentage of intra-county trips by purpose for the average weekday and weekend.

Trips for commercial purposes are the largest share of intra-county trips, about 45 percent of intra-county trips on weekdays and 56 percent on weekends.

While trip purpose emphasizes the immediate reason for a trip, trip chains place that trip within the context of a person's daily travel. About 34 percent of weekday intra-county trips and 51 percent of weekend intra-county trips are commercial trips that are not part of work/school trip chains, meaning they are trips made specifically for commercial purposes rather than stops at commercial locations during trips to or from work or school.

Figure 5-9 and **Figure 5-10** examine intra-county trip chains in more detail, specifically focusing on trip chain types and time-of-day distribution, respectively. As shown in the figures, **work/school trip chains make up about 42 percent of weekday trips, and more than half of them are bound for schools, not workplaces.** Intra-county trips that are a part of a work/school trip chain constitute about:

- 61 percent of trips in the AM peak period between 6 AM and 10 AM.
- 49 percent in the PM peak period between 2 PM and 6 PM, roughly equal to the percentage of trips in the non-work/non-school trip chains.
- 20-25 percent of trips during the midday (10 AM to 2 PM) and evening (6 PM to 10 PM) periods.
- 48 percent of all trips between 10 PM and 6 AM.

In all, about a quarter of intra-county trips in work/school trip chains occur outside of traditional AM and PM peak commute periods.

These patterns indicate that weekday trips are relatively balanced between work/school and non-work/non-school trip chains and even most work/school trip chains include stops to access services, shopping, and other non-work/non-school destinations (only 28 percent of weekday work trips go directly between home and work). Weekend trips are dominated by purposes other than work and school, particularly trips to commercial destinations.

The share of non-work/non-school trip chains is similar to work/school trip chains on weekdays and significantly higher on weekends. These trips are distributed throughout the day, with particularly high shares during midday and evening. This helps explain why:

- Overall midday travel is nearly as strong as peak periods (as shown in **Section 5.4**).
- Travel demand does not drop significantly outside traditional commute hours.

While traveling to and from work and school is an important component of travel, most of these work/school trip chains also integrate stops for other trip purposes. A majority of trips on both weekdays and weekends are not part of a work/school trip chain.

Why this matters for understanding travel behavior:

- Intra-county travel reflects day-to-day activity patterns, not just work schedules.
- A large share of trips are flexible in timing, unlike work/school trips.
- This flexibility contributes to steady travel demand throughout the day, rather than sharp peaks.
- It is common practice to include non-work stops on broader trip chains between home and work.

5.5.2 What is the Travel Purpose for Inter-County Trips?

Figure 5-11 presents charts showing the percentage of inter-county trips by for the average weekday and weekend.

Trips for commercial purposes are the largest share of inter-county trips, accounting for about 42 percent of trips on weekdays and 54 percent on weekends.

While trip purpose emphasizes the immediate reason for a trip, trip chains place that trip within the context of a person's daily travel. About 30 percent of weekday inter-county trips and 47 percent of weekend inter-county trips are commercial trips that are not part of work/school trip chains, meaning they are trips made specifically for commercial purposes rather than stops at commercial locations during trips to or from work or school.

Figure 5-12 and **Figure 5-13** examine inter-county trip chains in more detail, specifically focusing on trip chain types and time-of-day distribution, respectively. As shown in the figures, work/school trip chains make up about 44 percent of weekday trips, slightly higher than for intra-county trips. Inter-county trips that are a part of a work/school trip chain constitute about:

- 58 percent of trips in the AM peak period between 6 AM and 10 AM.
- 47 percent of trips in the PM peak period between 2 PM and 6 PM, above the 41 percent of trips in non-work/non-school trip chains.
- 30–40 percent of trips during the midday (10 AM to 2 PM) and evening (6 PM to 10 PM) periods.
- 55 percent of trips between 10 PM and 6 AM.

In all, over 40 percent of inter-county trips in work/school trip chains occur outside of traditional AM and PM commute peak periods.

Freight trips account for 8 to 11 percent of trips to and from the county on weekdays and weekends.

Weekday

Weekend

FIGURE 5-11

Inter-County Trip Purpose Distribution

Weekday

Weekend

FIGURE 5-12

Inter-County Trip Chain Type Distribution

Weekday

Weekend

FIGURE 5-13

Inter-County Work/School Trip Chain Type Distribution by Time of Day

These patterns show that inter-county travel is not driven solely by work or school trips, although they remain a key component. Inter-county travel is relatively balanced between work/school and non-work/non-school trip chains, with non-work/non-school trip chains more common during midday and evening, outside traditional peak commute periods. In addition, stops for services, shopping, and other non-work purposes remain a component of most work/school trip chains.

Instead of being dominated just by work/school travel, inter-county travel also reflects a broader set of needs, including:

- Access to retail, medical, and service destinations in nearby cities (e.g., Gilroy and Salinas)
- Freight and goods movement along regional corridors
- Social and recreational travel

This helps explain why inter-county travel:

- Contributes disproportionately to VMT (**Section 5.2**), due to longer trip distances
- Still displays less pronounced peak periods than might be expected if commute travel were dominant and concentrated during traditional peak commute periods

In other words, peak period commute is highly visible and important—particularly on certain corridors – but it represents only one component of a more diverse regional travel pattern.

Why this matters for understanding travel behavior:

- Inter-county travel reflects strong regional linkages, not just job access.
- Non-work trips play a significant role even in longer-distance travel.
- Corridor demand is shaped by a mix of purposes, not just peak-direction commuting.

5.5.3 What Characterizes Work Travel?

Work-related travel differs from other travel needs in important ways that influence transportation planning. Work trips tend to be longer, more geographically dispersed, and more dependent on regional connections than other types of travel.

Both Replica and American Community Survey (ACS) data indicate that work travel in the county is strongly automobile-oriented. Most residents have access to multiple vehicles, and most work trips are made by driving. In addition, according to ACS data, a substantial share of workers (approximately half) travel outside the county for employment, particularly to destinations in Santa Clara and Monterey counties. At the same time, a smaller share of workers travel short distances to work within the county, reflecting localized employment patterns.

Work trip lengths also show a distinct pattern compared to other trip types. Both Replica and ACS data indicate that travel distance for work trips are concentrated at the extremes, with a notable share of both very short and very long trips. Longer work trips contribute disproportionately to regional travel demand and VMT, while shorter work trips represent a smaller but important opportunity for local mode shift.

These characteristics suggest that work travel presents both constraints and opportunities for transportation planning. The long distances and regional nature of many work trips make shifts to non-automobile modes more challenging and may require coordination with neighboring jurisdictions to be effective. However, the presence of shorter, localized commutes indicates that targeted

improvements (such as enhanced walking and bicycling infrastructure, improved local transit service, and better connections within Hollister and surrounding communities) could support mode shift for a portion of the population.

At the same time, the prevalence of trip chaining, particularly trips that combine work with errands or other non-work activities, can complicate mode shift efforts by requiring travel options that accommodate multiple purposes within a work trip chain. For example, stopping for commercial activities on the way to or from work may require a vehicle to carry goods; conversely, traveling to work by alternative modes such as transit, walking, or bicycling can limit intermediate stops unless those destinations are also accessible by those same modes.

5.5.4 Policy and Planning Implications

Trip purpose patterns show that local and regional travel in San Benito County is roughly split between work/school and non-work/non-school trip chains on weekdays, but most work/school trip chains also include stops for other purposes, such as shopping and services. While travel to work or school during traditional peak commute periods plays a distinct role, most travel in San Benito County is spread throughout the day, including a substantial share of commercial travel as well as work or school travel that occurs outside traditional peak periods. These characteristics have important implications for transportation and land use strategies.

First, transportation systems designed primarily around traditional AM and PM peak period commuting is unlikely to reflect the majority of daily travel demand. Most trips occur across a wide range of times of day, particularly for commercial, social, and recreational purposes. While traditional peak period commute-focused investments remain important (especially along corridors connecting to Santa Clara and Monterey counties) they address only one component of overall travel demand.

Second, work travel characteristics highlight the importance of regional connectivity. A substantial share of workers travel outside the county, and these trips tend to be longer and more difficult to serve with non-automobile modes. As a result, improving mobility for work travel will likely require coordination with neighboring jurisdictions and a focus on key inter-county highway corridors. At the same time, a sizeable share of short, localized work travel presents an opportunity for targeted investments that support walking, bicycling, and local transit within and between communities such as Hollister and nearby areas.

Third, the prominence of commercial and other flexible-purpose trips underscores the importance of land use strategies that reduce the need for long-distance travel. Roughly 30 percent of weekday inter-county trips and 47 percent of weekend inter-county trips are solely for commercial purposes. Providing land uses that offer local access to essential services, such as retail and healthcare within the county can:

- Reduce dependence on inter-county travel
- Shorten trip lengths
- Create more opportunities for walking, bicycling, and local transit

Fourth, trip purpose patterns help explain earlier findings in this report:

- The limited dominance of traditional peak commute periods (**Section 5.4**) reflects the high share of non-work travel distributed throughout the day, as well as the relatively high share of work travel occurring outside of peak periods.

- The concentration of VMT in inter-county trips (**Section 5.2**) reflects the longer distances associated with both work and non-work travel.

Taken together, these findings suggest a balanced planning approach:

- Maintain and improve regional connections that support commute and other inter-county travel.
- Expand local access and mobility options to better serve the majority of trips that occur within the county.
- Align transportation and land use strategies with diverse ways people actually travel, rather than focusing solely on AM and PM peak period commute.

5.6 How do People Travel?

The final step in the countywide travel behavior analysis is to understand how people travel. Mode choice reflects the combined influence of land use, transportation infrastructure, and traveler preferences, and provides important insight into how well the transportation system supports different types of trips.

This section examines the distribution of travel modes for trips interacting with San Benito County, distinguishing between intra-county and inter-county travel.

5.6.1 What are the Mode Share Patterns of Trips Traveling within the County and for Trips Traveling to and from the County?

Most trips in San Benito County are made by private vehicles, accounting for approximately:

- 80 percent of weekday intra-county trips
- 87 percent of inter-county trips

Walking accounts for a smaller share of intra-county travel (approximately 11 percent), while bicycling represents about 1 percent.

Observed counts and Replica model outputs are generally consistent in indicating that travel in San Benito County is dominated by auto modes, with relatively low levels of walking, bicycling, and transit use (see **Appendix E**). Where differences occur, they are primarily associated with lower-volume modes and location-specific conditions, which is consistent with known limitations of big data sources in capturing active transportation activity. **Figure 5-14** shows the percentage of trips by travel mode and time period for both intra-county and inter-county travel on weekdays.

Mode shares vary across geographies within the county. For example:

- Travel within **Hollister** generally reflects the overall intra-county pattern, with a slightly higher share of walking.
- Travel within **San Juan Bautista** has a lower vehicle share (about **50 percent**) and higher walking share (about **35 percent**).

These patterns indicate that San Benito County is highly automobile-dependent, particularly for inter-county travel. The higher vehicle share for inter-county trips reflects longer travel distances and the limited availability of viable alternatives for regional travel.

At the same time, the presence of walking trips within the county—especially in areas like Hollister and San Juan Bautista—suggests that short-distance travel does support non-auto modes where conditions allow. This aligns with earlier findings that:

- Most intra-county trips are short (**Section 5.2**).
- A large share of trips are for commercial and local purposes (**Section 5.5**).

However, despite these favorable conditions for shorter trips, the dominance of vehicle travel indicates that land use patterns, network design, and service availability currently limit the ability of residents to shift to other modes.

Differences across communities also highlight that urban form and scale matter:

- Smaller or more compact areas (e.g., San Juan Bautista) show greater potential for walking.
- More dispersed areas are more likely to rely on driving for most trips.

Why this matters for understanding travel behavior:

- Mode choice is strongly influenced by trip length and available infrastructure.
- Even where trips are short, non-auto modes require supportive conditions to be viable.
- Inter-county travel is particularly difficult to serve with alternatives due to distance and regional connectivity constraints.

Mode Share Distribution by Trip Type

5.6.2 What is the Transit Mode Share for the County?

The County Express public transit service in San Benito County is operated by the San Benito County Local Transit Authority (LTA). The main transit routes consist of the County Express Tripper and the Intercounty Express, supplemented by Dial-A-Ride and paratransit services.

County Express Tripper provides service to San Benito High School, Rancho San Justo Middle School, Marguerite Maze Middle School, and other Hollister schools during weekday peak school arrival and dismissal hours. Regular weekday service consists of two morning trips between 6 and 8 AM and two afternoon trips between 3 and 5 PM, with the first afternoon trip limited to selected schools. On Thursdays, the afternoon trips operate between 2 and 4 PM, with the first trip also serving only specific schools.

The Intercounty Express connects Hollister and San Juan Bautista to Gilroy, specifically to the Gilroy Caltrain Station on both weekdays and weekends, and the Gavilan College Gilroy campus on weekdays. The Intercounty Express operates with approximately 60-minute headways during the day, increasing to 30-minute headways during traditional AM and PM peak commute periods.

In addition to the County Express Tripper and the Intercounty Express, the San Benito County LTA also provides Specialized Transportation (ST) services that offer essential mobility options for seniors and individuals with disabilities through reservation-based programs. These services include Non-Emergency Out of County Medical Transportation (OOCMT), which supports access to medical care outside the county, and the Medical Shopping Assistance Program (MSAP), which serves in-county trips to medical appointments, banks, grocery stores, and pharmacies. In addition, the Senior Lunch Transportation Program (SLTP) offers trips to the Community Center in Hollister for participants in the Senior Lunch Program. MSAP and SLTP services operate Monday through Friday, while OOCMT services are available Monday through Saturday.

Although precise systemwide transit trip counts are not directly captured in the Replica dataset, available ridership data indicate that transit accounts for less than 1 percent of total person trips in San Benito County. This estimate is based on a comparison of average daily passenger trips estimated from LTA ridership data for all transit services during the highest ridership month of 2025 (approximately 270 passenger trips per day) with the average daily number of countywide trips estimated by Replica (approximately 265,600 trips per day).

To better understand the relationship between transit availability and transit use, we focused on the City of Hollister and evaluated trips that occur within proximity to fixed-route transit stops at both the origin and destination. This analysis was intended to estimate the share of trips that could reasonably be served by transit and compare it to the share of trips currently made by transit. The results indicate that approximately 89,200 average daily trips occur near transit at both ends of the trip in Hollister, compared to fewer than 1 percent of trips (approximately 90 daily trips) that are made by transit, including both County Express Tripper and Dial-A-Ride services. This comparison highlights a gap between theoretical transit accessibility and observed mode choice. This low level of ridership contrasts with the broader distribution of travel activity in areas served by transit. A substantial share of trips occurs within Hollister, where both origins and destinations are relatively concentrated and where County Express Tripper and Dial-A-Ride services operate.

While these services provide coverage to key destinations, current ridership levels indicate that only a small share of trips within these service areas are made by transit. This suggests a mismatch

between transit availability and observed travel patterns, where more trips occur in transit-served areas than are captured by the system.

This gap between potential access and actual use suggests that factors such as service frequency, span, routing, and first- and last-mile connectivity may limit transit's ability to serve existing travel demand.

This finding is also consistent with earlier results showing that travel demand in the county is distributed throughout the day and across a mix of trip purposes, many of which are not well aligned with the primarily peak-oriented structure of existing transit service.

In addition to Replica data, the analysis incorporates available baseline data provided by SBCOG, including transit ridership information from LTA and observed active transportation counts at key locations. These data sources are used to supplement and ground-truth the big data outputs, particularly in assessing transit use and active transportation mode shares, and to provide additional context for interpreting observed travel patterns.

The very low transit share reflects both the structure of the network and the underlying travel patterns in the county.

Key contributing factors include:

- Limited service frequency and geographic coverage, particularly outside of peak periods or school-oriented trips
- Dispersed land use patterns, which reduce the efficiency and effectiveness of fixed-route transit
- A large share of trips occurring outside traditional peak commute periods, which are the primary focus of existing transit service

This mismatch between when trips occur (**Section 5.4**) and when transit service is most available limits transit's ability to capture a larger share of trips.

Why this matters for understanding travel behavior:

- Current transit service is aligned with a narrow subset of travel demand, particularly school and work travel during traditional peak commute periods.
- Many trips that occur throughout the day are not well served by the existing network.
- Expanding mode share for transit would require changes to both service design and land use context, not just marginal improvements.

5.6.3 Policy and Planning Implications

Mode share patterns reinforce that San Benito County's transportation system is currently structured around automobile travel, with limited use of pedestrian, bicycle, or transit modes.

The dominance of private vehicles reflects both the nature of travel demand and the constraints of the existing transportation system. While many trips are short and could potentially be served by walking, bicycling, or local transit, current conditions often make driving the most practical and reliable option.

At the same time, the data suggests that there are targeted opportunities for mode shift, particularly for intra-county travel:

- Short trip lengths and concentrated activity in areas like Hollister create opportunities for walking, bicycling, and local transit.
- Differences between communities indicate that compact areas can support higher shares of non-auto travel.

However, for inter-county travel, the potential for mode shift is more limited:

- Longer travel distances and dispersed destinations make alternatives to driving more difficult to implement.
- Meaningful changes would require regional transit improvements and coordination with neighboring jurisdictions.

Transit, in particular, presents both challenges and opportunities:

- Existing service is limited and results in a very low mode share.
- However, aligning service with all-day travel patterns and key destinations could improve its effectiveness.

These findings suggest that mode shift strategies should be targeted and context-sensitive, rather than uniform across the county:

- Focus on local improvements that support non-auto travel where trip lengths and land use patterns are favorable.
- Maintain and improve regional connectivity for longer trips, recognizing the continued importance of driving.
- Consider service design changes that better reflect when and why people travel, rather than focusing solely on peak-period commuting.

Overall, the findings highlight that increasing travel choices in San Benito County will require a coordinated approach that addresses land use, infrastructure, and service design together, rather than relying on any single strategy.

5.7 What Are the Collision Trends in the County?

This section complements the evaluation of travel behavior by examining collision trends in San Benito County. Understanding where and how collisions occur provides important context for interpreting how the transportation system is used and where safety risks are concentrated today.

Collision data were obtained from the UC Berkeley Transportation Injury Mapping System (TIMS), which compiles police-reported crashes involving injuries or fatalities. The dataset reviewed includes collisions occurring between 2020 and 2025 across San Benito County.

TIMS data includes information on location, severity, and the types of road users involved in each collision. TIMS captures only injury and fatal collisions. It does not reflect property-damage-only crashes and therefore represents the more severe subset of total collisions. As a result, the findings in this section are most relevant for understanding safety outcomes rather than total crash frequency.

5.7.1 What Collision Trends are Observed?

Between 2020 and 2025, 1,745 injury collisions have occurred within San Benito County, of which 254 (15 percent) have resulted in a fatality or severe injury. This rate of fatal and severe collisions is higher than the statewide average of 11 percent. Though a majority of collisions only involved vehicles, collisions involving pedestrians (4 percent of collisions), bicycles (4 percent), or motorcycles (8 percent) were more likely to result in fatalities or severe injuries than the statewide average. A total of 108 collisions, about 6 percent, involved trucks. Overall, the number of injury collisions has trended upwards, from near 200 in 2020 to around 300 in 2025. However, the percent of collisions that are fatal or severe decreased slightly over the same period.

These collision statistics are generally consistent with rural road networks that are dominated by vehicle travel and where victims of severe collisions are disproportionately more vulnerable road users such as pedestrians, bicyclists, and motorcyclists. A majority of San Benito County collisions occurred on highway corridors, with about 55 percent of all injury collisions and 75 percent of all collisions involving trucks. In total, 22 percent of all collisions occurred along SR 25, 19 percent along SR 156, and 16 percent along SR 101. The majority of remaining collisions occurred within Hollister, with about 30 percent of all injury collisions and 90 percent of bicycle and pedestrian collisions. With less traffic and fewer population centers, the southern part of the county accounts for only about 5 percent of all injury collisions.

Many collisions are concentrated at particular hot spots, which are shown in **Figure 5-15. The highest concentration of collisions in San Benito County is the intersection of SR 25 and SR 156. Since the construction of a new roundabout at this intersection, injury collisions have more than doubled.** However, no fatal or severe collisions have occurred since the construction of the roundabout, indicating a potential improvement in collision severity.

Other frequent collision locations include:

- San Benito Street/SR 156 Business in downtown Hollister
- 4th Street/SR 156 Business in downtown Hollister
- Tres Pinos Road in downtown Hollister
- US 101 between San Juan Road and SR 156
- SR 156 at US 101

- SR 156 and Buena Vista Road
- SR 156 and San Felipe Road/SR 156 Business
- SR 156 and Fairview Road
- SR 25 and San Felipe Road/SR 156 Business
- SR 25 and Shore Road

Collision patterns reflect how different parts of the transportation system function and how they are used. The concentration of collisions on the state highway network aligns with earlier findings that these corridors carry a large share of regional and pass-through travel, including freight movement. These travel patterns contribute to higher speeds, longer trip lengths, and more complex interactions between vehicle types, all of which influence collision frequency and severity.

At the same time, the concentration of bicycle and pedestrian collisions in Hollister and other developed areas reflects localized travel patterns characterized by shorter trips, greater multimodal activity, and more frequent interactions between vehicles and non-vehicle users.

Together, these patterns indicate that safety outcomes are closely tied to both regional travel flows and local land use and mobility conditions. In other words, the same system that supports long-distance inter-county travel also shapes local travel behavior and safety outcomes in different ways depending on context.

FIGURE 5-15

San Benito County Frequent Collision Locations

5.7.2 Policy and Planning Implications

Collision trends highlight the need for a context-sensitive approach to transportation planning and investment in San Benito County. Different parts of the network serve different functions and face distinct safety challenges.

First, the concentration of collisions on the state highway network suggests that improving safety along these corridors will require coordination with regional and state agencies. Because these corridors primarily serve inter-county and pass-through travel, local strategies alone may have limited influence on overall collision patterns. Investments that address speed management, freight movement, and corridor design will be critical for improving safety outcomes on these facilities.

Second, the concentration of bicycle and pedestrian collisions in Hollister and other developed areas underscores the importance of local safety improvements. Enhancing pedestrian and bicycle infrastructure such as completing sidewalk gaps and adding bike lanes, improving crossings, and designing streets that better support multimodal travel can reduce conflict points and improve safety for vulnerable road users.

Third, the relationship between travel behavior and collision patterns reinforces earlier findings in this report. Corridors that carry high volumes of regional travel are also where safety risks are elevated, while areas with high local activity experience more multimodal conflicts. This suggests that safety strategies should be integrated with broader transportation and land use planning efforts.

Taken together, these findings indicate that effective safety strategies will require:

- Regional coordination to address safety along major highway corridors serving inter-county and freight travel
- Targeted local investments to improve safety for pedestrians, bicyclists, and other vulnerable users
- Integration of safety considerations into decisions about mobility, access, and land use to better align system performance with how people travel

6. Corridor-Specific Travel Behavior

The previous chapter establishes a foundational context by providing an understanding of countywide travel behavior and how it informs policy and investment decisions in San Benito County. Building upon this context, this chapter examines corridor-specific travel behavior to better understand how regional and local travel interact with the county's roadway network.

State Route (SR) 25, SR 156, and US 101 are county's primary highway corridors. Together they shape regional mobility, influence where growth can occur, and determine how residents, workers, and goods move into, out of, and through the county. Understanding how these corridors function (and the types of trips they carry) supports near-term improvement projects and long-term infrastructure planning.

The analysis focuses on three locations along the primary highway corridor where most trips enter and exit San Benito County, to capture the characteristics of intercounty travel associated with this corridor:

- SR 25 at the North County Line
- SR 156 East of US 101
- SR 156 at the North County Line

While the SR 156 east of US 101 location is not at a county border like the other two locations, it captures trips traveling west through the county to Monterey County via US 101, north to Santa Clara County via US 101, and to Santa Cruz County via SR 129.

Together with the SR 156 north county line location, this segment allows us to capture inter-county travel characteristics at both ends of the SR 156 corridor. For each location listed above, the analysis uses Replica data to evaluate the balance between inter-county trips and pass-through travel, average inter-county trip lengths, trip purpose distribution, and the most common commercial and work/school destinations.

This analysis focuses on inter-county travel characteristics along the primary SR 156 corridor and therefore does not include locations on US 101 at the county line. US 101 primarily serves pass-through traffic, while most non pass-through movements are captured at the SR 156 east of US 101 location. Pass-through travel on US 101 is discussed separately below.

Because Replica generates modeled estimates rather than direct observations, the results should be interpreted as representative patterns rather than precise real-world measurements.

Data supporting the corridor-specific travel behavior analysis is included in **Appendix C** for transparency and future use.

6.1 What Are the Travel Characteristics of SR 25?

SR 25 is a critical north–south corridor in San Benito County, carrying a mix of locally generated travel within the county, work or school travel between San Benito County and nearby counties, and inter-county travel for other purposes that occurs throughout the day. This subsection examines the travel characteristics of inter-county trips entering or exiting the county via SR 25 at the north county line, with a focus on understanding trip types, trip purposes, and key destinations associated with travel along this corridor. By documenting how the corridor is used today, the analysis provides context for evaluating how changes to capacity or operations (such as potential SR 25 expansion) may influence future travel behavior and county-generated VMT.

6.1.1 What Trip Types and Purpose Define Travel via SR 25 at the North County Line?

Among the three analysis locations along the primary highway corridor that capture the majority of San Benito County’s inter-county travel, about 52 percent of trips enter or exit the county via SR 25 at the north county line (as shown in **Figure 5-2**).

Less than 1 percent of trips are pass-through trips. The average length of trips traveling through SR 25 at the north county line is 35 miles.

Trips for commercial purposes are the largest share of inter-county trips entering or exiting the county via SR 25, accounting for about 49 percent of inter-county trips on weekdays and 60 percent of inter-county trips on weekends.

While trip purpose emphasizes the immediate reason for a trip, trip chains contextualize it within a person’s daily travel. About 36 percent of weekday inter-county trips and 52 percent of weekend inter-county trips are commercial trips that are not part of work/school trip chains, meaning they are made specifically for commercial purposes rather than as stops at commercial locations during trips to or from work or school.

Figure 6-1 presents the weekday and weekend distribution of trip chains that enter or exit the county via SR 25 at the north county line.

On weekdays, about 46 percent of inter-county travel through this analysis location are part of work/school trip chains. On weekends, the share of work/school trip chains drops to about 23 percent. The time-of-day patterns for work/school trip chains are similar to the inter-county travel patterns discussed in **Section 5.5**.

These patterns, along with the relatively strong share of commercial trips and trips for purposes other than work or school, show that inter-county travel on SR 25 is not driven exclusively by traveling to work or school, even though it is a major component.

Weekday

Weekend

FIGURE 6-1

Inter-County Trip Chain Type Distribution — SR 25 at the North County Line

6.1.2 Where are the Most Popular Commercial and Work/School Destinations for County Residents Traveling through the SR 25 at the North County Line?

Figure 6-2 and **Figure 6-3** present popular commercial and work/school destinations, respectively, for county residents traveling through the SR 25 at the north county line.

As shown in the figures, Gilroy east of US 101 is the most popular commercial destination for county residents. This area includes the Gilroy Premium Outlets and other shopping centers.

Gilroy, San José and the cities surrounding San José such as Santa Clara and Cupertino are the most popular work/school destinations. Within these cities, popular work or school destinations may include commercial centers in Gilroy, such as the Gilroy Premium Outlets, Gavilan College, technology campuses in northern Santa Clara County, and major employment centers in San Jose, including the Trimble Business Area.

The commercial and work/school destination patterns indicate that a significant share of inter-county trips from San Benito County are made to the southern part of Santa Clara County for work, school, as well as other purposes such as commercial activities. This is consistent with the findings in **Section 5.2**, which show that the majority of inter-county trips are longer-distance trips, aligning with the average trip length of 30 to 40 miles.

FIGURE 6-2

Popular Commercial Destination for County Residents – SR 25 at the North County Line

FIGURE 6-3

Popular Work/School Destinations for County Residents – SR 25 at the North County Line

6.1.3 Policy and Planning Implications

Inter-county travel via SR 25 is largely balanced between work/school trips and trips for other purposes on weekdays, with relatively little pass-through traffic. Trips that are not for school or work are generally more flexible and more sensitive to changes in travel time and convenience than work/school trips because they are less constrained by fixed schedules and destinations.

Due to the substantial demand for work/school travel, capacity expansion on SR 25 is likely to induce additional commercial and discretionary travel rather than primarily improving work/school travel efficiency, especially outside of the traditional peak commute periods and weekends. Given the corridor's existing travel profile, added capacity would be expected to increase county-generated travel and VMT, particularly for non-work trips that occur throughout the day.

The concentration of work and commercial destinations in southern Santa Clara County (especially Gilroy and areas near San José) also highlights opportunities to better align inter-county transit service with observed travel patterns. While the Intercounty Express provides a connection to the Gilroy Caltrain Station, it does not directly serve the most frequently visited commercial destinations in Gilroy and is constrained by limited first- and last-mile access in Hollister. The County Express Tripper's school-oriented service further limits its usefulness for non-school travel and ability to provide such a first- and last-mile connection.

Below are strategies that may offer more effective mobility and VMT outcomes than roadway capacity expansion alone:

- Strengthening inter-county transit connections with more direct routing
- Improve transit access to key destinations and enhance first- and last-mile options to help provide viable alternatives to driving for trips using the SR 25 corridor

6.2 What Are the Travel Characteristics of SR 156?

State Route (SR) 156 serves as San Benito County's primary east/north–west regional connector and a key freight corridor linking the Central Coast to the Central Valley, US 101, and the greater Bay Area. As a result, the corridor accommodates a wide range of travel, including local trips, inter-county travel, freight movement, and regional pass-through traffic.

This section examines travel characteristics at the two ends of the SR 156 corridor in San Benito County, which serve distinct functions within the regional network:

- **SR 156 east of US 101** – provides connections north to Santa Clara County via northbound US 101, and west to Santa Cruz County or south to US 101 at the west county line in Monterey County.
- **SR 156 at the North County Line** – provides connection west to the Central Valley via SR 152.

Analyzing these separately allows for a clearer understanding of how different travel markets interact with the corridor and how travel patterns vary by direction and regional context.

Together, the findings provide insight into the role SR 156 plays in supporting goods movement, regional connectivity, and local access, and help inform corridor-specific planning and investment strategies.

6.2.1 What Trip Types and Purpose Define Travel Through the SR 156 East of US 101?

About 35 to 40 percent of trips entering and exiting the county via SR 156 east of US 101 are pass-through trips. These trips travel across the county without stopping within it, primarily connecting areas west of the county, such as Monterey and Santa Cruz counties, to destinations to the northeast, including Merced County, and vice versa.

Among the three analysis locations where most inter-county trips enter and exit San Benito County, about 38 percent of trips travel into or out of the county via SR 156 east of US 101 (as shown in **Figure 5–2** in **Section 5.1**).

Trips for commercial purposes are the largest share of inter-county trips entering or exiting the county via SR 25, accounting for about 37 percent of inter-trips on weekdays and 50 percent on weekends. Freight trips account for about 13 percent of weekday inter-county trips and 9 percent of weekend inter-county trips.

While trip purpose emphasizes the immediate reason for a trip, trip chains place that trip within the context of a person's daily travel. About 25 percent of weekday inter-county trips and 43 percent of weekend inter-county trips are commercial trips that are not part of work/school trip chains, meaning they are trips made specifically for commercial purposes rather than stops at commercial locations during trips to or from work or school.

Figure 6–4 presents the weekday and weekend distribution of trip chains that enter or exit the county via SR 156 east of US 101.

On weekdays, about 49 percent of inter-county trips traveling through this analysis location are part of work/school trip chains. On weekends, the share of work/school trip chains drops to about 26

percent. The time-of-day patterns for work/school trip chains are similar to the inter-county travel patterns discussed in **Section 5.5**.

Similar to travel on SR 25, traveling to work or school is a major component of travel on SR 156; however, inter-county travel is not exclusively driven by work/school trips.

FIGURE 6-4

Inter-County Trip Chain Type Distribution — SR 156 East of US 101

6.2.2 Where are the Most Popular Commercial and Work/School Destinations for County Residents Traveling Through SR 156 East of US 101?

Figure 6-5 and **Figure 6-6** present the popular commercial and work/school destinations, respectively, for county residents entering or exiting the county via SR 156 east of US 101.

Similar to the destination patterns observed on SR 25 at the north county line, Gilroy is also a popular commercial destination for trips entering or exiting the county via SR 156 east of US 101. In addition, Monterey County, particularly the areas near Salinas and the Prunedale area west of the county border (which includes the 101 Red Barn), is a frequent commercial destination for these travelers. The 101 Red Barn is a major generator of commercial trips, as it operates as a farmers market selling fruits and vegetables and frequently hosts events such as flea markets and swap meets on weekends.

Monterey, Gilroy, and Salinas are notable destinations for work/school trips traveling through SR 156 East of US 101. Popular work and school destinations may include commercial centers in Gilroy, such as the Gilroy Premium Outlets, Gavilan College, California State University Monterey Bay, and employment centers near downtown Salinas and Monterey. These destinations represent common regional travel patterns for San Benito County residents commuting for employment, education, shopping, and other activities.

This confirms strong regional connections to northern Monterey County and southern Santa Clara County and that employment centers are more geographically dispersed.

FIGURE 6-5

Popular Commercial Destinations for County Residents – SR 156 East of US 101

FIGURE 6-6

Popular Work/School Destinations for County Residents – SR 156 East of US 101

6.2.3 What Trip Types and Purpose Define Travel Through SR 156 at the North County Line?

About 10 percent of trips that enter or exit the county via SR 156 at the north county line (as shown in **Figure 5-2**). This represents a significantly lower share compared to trips entering or exiting the county via SR 25 or the western end of SR 156 that connects to US 101. These trips primarily travel to and from areas northeast of the county, such as Merced County.

About 69 percent of trips entering and exiting the county via SR 156 at the north county line are pass-through trips.

While the two analysis locations at the ends of SR 156 (SR 156 east of US 101 and SR 156 at the north county line) experience different shares of pass-through traffic, the combined percentages indicate that a significant share of SR 156 roadway activity is driven by regional travel moving through the county rather than by local travel needs. This pattern helps explain why the SR 156 corridor may experience traffic volumes that do not align with local land use or population patterns. As discussed in more details in **Section 5.1**, the significant share of pass-through travel on SR 156 increases congestion and VMT but is not directly influenced by local land use or transportation policies. County-level decisions alone are unlikely to meaningfully change these travel patterns.

Approximately 41 percent of weekday inter-county trips entering or exiting the county via SR 156 at the north county line are freight trips. This share decreases to 28 percent on weekends. Social trips, defined as trips between private residences, account for a notable share of weekend inter-county travel (18 percent). Commercial trips account for about 29 percent of inter-county trips on weekdays and 43 percent on weekends.

While trip purpose emphasizes the immediate reason for a trip, trip chains place that trip within the context of a person's daily travel. About 20 percent of weekday inter-county trips and 38 percent of weekend inter-county trips are commercial trips that are not part of work/school trip chains, meaning they are trips made specifically for commercial purposes rather than stops at commercial locations during trips to or from work or school.

Looking at distribution of work/school trip chains, on weekdays, about 26 percent of inter-county trips entering and exiting the county on SR 156 at the north county line are part of work/school trip chains.

6.2.4 Policy and Planning Implications

The SR 156 corridor plays a dual role as both a regional freight route and a connector for local and inter-county travel, but travel characteristics differ substantially between its two ends in San Benito County. These differences have important implications for how the corridor should be planned, managed, and invested in.

The western end of SR 156 supports a diverse mix of inter-county travel, including work/school trips, commercial travel to the Bay Area and the Salinas Valley and other coastal areas, and pass-through trips connecting coastal regions with the Central Valley. Compared to the eastern end, the western end plays a stronger role in meeting inter-county travel needs, particularly for access to employment and commercial destinations in Monterey County, Salinas, and Gilroy.

Similar to strategies that may offer more effective mobility and VMT outcomes on SR 25, strengthening inter-county transit connections through more direct routing, improved access to key destinations, and enhanced first- and last-mile options could provide viable alternatives to driving for trips on SR 156 that connect to US 101 and serve destinations in the Bay Area, the Salinas Valley, and other coastal areas.

In contrast, the northern end of SR 156 is dominated by regional pass-through travel, particularly long-distance freight and commercial trips associated with the Central Valley. Because most trips traveling through SR 156 at the north county line do not begin or end in San Benito County, targeted policies focused on this end of SR 156 would primarily support regional mobility and goods movement, with limited direct benefits for local access or changes in travel behavior among county residents.

Together, these patterns indicate that SR 156 cannot be treated as a uniform corridor. Effective strategies will need to be tailored to each end of the corridor, balancing freight reliability and regional connectivity at the north end with multimodal access, local mobility, and inter-county travel needs at the west end. **Coordinated planning among local, regional, and state agencies will be essential to ensure that investments along SR 156 appropriately reflect the distinct functions the corridor serves at each end.**

6.3 What Are the Travel Characteristics of Trips Traveling on US 101?

Travel on US 101 within San Benito County is dominated by pass-through traffic. Approximately 75 to 90 percent of trips using this segment do not begin or end in the county on either weekdays or weekends.

6.3.1 Policy and Planning Implications

The US 101 segment within San Benito County primarily serves regional pass-through travel rather than local access. As a result, improvements along this corridor are likely to benefit travelers moving between other regions more than county residents. While investments may improve regional mobility and goods movement, they are expected to provide limited direct mobility benefits for local trips and should be evaluated accordingly when considering county-level transportation priorities. See **Section 5.1** for more detailed policy and planning implications related to pass-through travel.

6.4 What Are the Travel Characteristics of Trips Using Shore Road?

Shore Road primarily functions as a local access corridor, supporting travel between nearby communities rather than serving as a regional through route.

Approximately 30 to 40 percent of Shore Road traffic serves local areas west of SR 156, including Dunneville and destinations along Shore Road and Fairview Road west of SR 156. Another 40 to 50 percent serves areas east of SR 156 along Fairview Road. Less than 10 percent of Shore Road traffic continues north to SR 152. In the westbound direction, most trips continue to SR 25, with a smaller share associated with Frazier Lake Road.

It is worth noting that Replica substantially underestimates volumes on Fairview Road (by approximately 50–60 percent) and Frazier Lake Road (by roughly 90 percent). This discrepancy suggests that an even greater number of trips may be using the Frazier Lake Road cutoff than indicated by Replica. In contrast to the Replica estimates discussed above, observed traffic counts show relatively balanced northbound and southbound daily volumes, indicating that travel on these routes may be more bidirectional than Replica suggests. A comparison of Replica estimates to traffic counts is provided in **Appendix E** for transparency.

While limitations in the Replica data may reduce the accuracy of the analysis in identifying the local corridors that trips on Shore Road travel to or from, they do not change the overall conclusion. The majority of trips using Shore Road are local-serving rather than regional in nature, supporting access to nearby communities and destinations rather than longer-distance travel from the Central Valley via SR 152.

As noted previously in **Section 0**, the intersection of SR 25 and Shore Road is one of the more frequent collision locations in San Benito County, underscoring the importance of safety improvements at this intersection. Other locations along Shore Road do not exhibit similarly high collision patterns.

6.4.1 Policy and Planning Implications

Shore Road primarily supports local travel needs, rather than functioning as a bypass for SR 152. As a result, **improvements along this corridor are likely to deliver direct benefits to local mobility, safety, and access for adjacent communities.**

The presence of some eastbound traffic associated with Frazier Lake Road suggests limited use of Shore Road as a bypass of SR 25 for trips originating north of SR 152. While this pattern warrants awareness, it does not appear to be the corridor's dominant function. Overall, planning and investment decisions for Shore Road should prioritize local access, safety, and community connectivity, rather than regional traffic accommodation.

7. Recreation and Tourism Travel Patterns

This chapter examines recreation and tourism travel in San Benito County using trip-level Azira data to identify the most popular destinations and the likely origins of visitors traveling to these locations. Because recreation and tourism activity is most concentrated on weekends, the analysis emphasizes weekend travel patterns to capture peak visitation behavior.

The analysis focuses on the following recreation and tourism destinations:

- Pinnacles National Park (east and west entrances)
- Fremont Peak State Park
- Hollister Hills State Vehicular Recreation Area
- San Juan Bautista Historic State Park
- Mission San Juan Bautista
- Juan Bautista De Anza National Historic Trail/Anza Trail
- San Juan Oaks Golf Club
- Ridgemark Golf Course
- TAG Adventure Park – Paintball Center
- Bolado Park / Event Center

Appendix D includes a series of dot distribution maps illustrating the geographic origins of trips to these destinations in San Benito County and from surrounding regions.

Because Azira is a cellphone-based data source that captures a sample of total observed trips, the results should be interpreted as representative patterns rather than precise counts. Despite these limitations, the data provides valuable insight into the relative geographic reach of recreation and tourism destinations and the travel markets they serve.

7.1 Where Are the Origins of Trips Traveling to Popular Recreation and Tourism Destinations?

Recreation and tourism destinations in San Benito County attract visitors from a range of geographic areas, with notable differences in the scale and reach of individual destinations.

Most recreation and tourism locations—including Bolado Park/Event Center, Ridgemark Golf Course, San Juan Oaks Golf Club, and destinations within the City of San Juan Bautista—draw a majority of visitors from within San Benito County. These trips are primarily generated by nearby communities, particularly Hollister, with additional visitors traveling from southern Santa Clara County and northern Monterey County. These patterns indicate that many recreation and tourism trips are relatively local or short-distance in nature.

Hollister Hills State Vehicular Recreation Area exhibits a broader regional draw than other county destinations. While it attracts visitors from within San Benito County, it also draws a substantial number of trips from across the Bay Area, reflecting its unique recreational offerings and regional appeal.

In contrast, Pinnacles National Park attracts visitors from a much wider geographic area than any other destination examined. Although many visitors originate from San Benito County, Monterey

County, and southern Santa Clara County, a significant share of trips originate from farther away. Travel patterns also differ by entrance: the east entrance is more commonly used by residents of San Benito County and southern Santa Clara County, while the west entrance primarily serves visitors from Monterey County and more distant locations. Despite this broad reach, most visitors still originate from within California.

These origin patterns highlight meaningful variation in how recreation and tourism destinations function, ranging from locally oriented sites that primarily serve county residents to regionally significant destinations that attract visitors from well beyond the county.

Methodological Note: This analysis assumes the most common evening location represents a traveler's home location. Azira is a cellphone-based data source and typically captures 5 to 15 percent of total observed trips. Data coverage is particularly limited at Pinnacles National Park due to poor cellular reception. As a result, the findings should be interpreted as representative patterns rather than complete counts, but they remain useful for understanding the relative geographic reach of different destinations.

7.1.1 Policy and Planning Implications

Recreation and tourism travel patterns indicate that many destinations in San Benito County primarily serve local and nearby visitors, while a smaller number (most notably Pinnacles National Park) function as regional destinations with a much broader draw. These differences suggest that recreation and tourism travel cannot be addressed with a single, uniform strategy.

For locally oriented destinations, improving local access, safety, and weekend mobility options (including walking, biking, and limited local transit) may provide the greatest benefit to residents and visitors. In contrast, regionally significant destinations generate longer-distance travel that may warrant targeted regional coordination, including improved wayfinding, visitor information, and potential inter-county transit connections during peak periods.

Understanding where recreation and tourism trips originate helps agencies better align weekend and off-peak transportation strategies with observed demand, supporting access to key destinations while managing congestion and enhancing the visitor experience without over-investing in infrastructure intended to serve primarily local trips.

8. Applications to Travel Model Updates

This chapter describes how the findings from the San Benito County Travel Behavior Analysis can support updates to regional travel demand models used for planning, project evaluation, and environmental analysis.

Rather than recommending a full model replacement, this chapter focuses on targeted enhancements to existing models that improve their ability to reflect observed travel behavior and meet state and federal expectations for calibration, validation, and project application. These recommended enhancements are consistent with established California Department of Transportation (Caltrans) and the Federal Highway Administration (FHWA) guidelines.

8.1 Key Findings Inform Future Model Updates

The Association of Monterey Bay Area Governments (AMBAG) Regional Travel Demand Model and the City/County Association of Governments and the Santa Clara Valley Transportation Authority (C/CAG-VTA) travel demand model cover portions of the San Benito County travel area with varying levels of detail; however, neither is currently well suited for direct application to countywide or project-level forecasting.

These models were originally developed to forecast peak-period, commute-oriented travel at a regional scale. As a result, they do not fully capture the range of travel behavior observed in San Benito County, including inter-county travel, pass-through traffic, non-work travel, and travel occurring outside of traditional peak periods.

Both models would benefit from targeted enhancements to better represent these travel patterns and improve their usefulness for local and regional decision-making.

These limitations can affect model performance for corridor studies, long-range planning, project-level transportation analyses, and environmental impact analysis where VMT outcomes are highly influenced by longer regional trips. Improving representation of these travel patterns would increase confidence in model forecasts and better support transportation decision-making.

The travel behavior analysis identifies several key characteristics of the system that are not fully captured in existing regional models:

- Inter-county travel represents a smaller share of total trips but generates the majority of VMT.
- Pass-through and regional travel drive corridor congestion and system performance.
- Travel demand is distributed throughout the day, including midday and weekend periods.
- Short intra-county trips dominate daily activity, but contribute relatively little to overall VMT.

These findings highlight an important distinction between local travel, which supports daily mobility and accessibility, and regional travel, which drives VMT and corridor-level performance. Improving the representation of inter-county, pass-through, non-work, and off-peak travel in regional models would better reflect observed travel behavior in San Benito County, resulting in more reliable forecasts for corridor studies, long-range planning, project development, and environmental impact analyses.

8.2 Model Enhancements and Implementation Approach

This section describes suggested enhancements recommended to improve the ability of existing regional travel demand models to represent observed travel behavior in San Benito County. As with any project-level transportation or land use analysis, the selected travel model should meet applicable regional and local requirements, and these recommendations presume familiarity with standard model evaluation and documentation practices.

A phased implementation strategy is recommended to align technical improvements with available agency resources:

- **Near-term efforts:** focus on improving representation of external travel, strengthening validation procedures, and enhancing model documentation.
- **Mid-term efforts:** focus on refining time-of-day factors, trip purpose assumptions, and local calibration inputs using observed travel behavior data.
- **Long-term efforts:** include evaluation of more advanced modeling approaches, such as hybrid or activity-based modeling frameworks, if warranted by future planning needs and available resources.

Below are some specific recommended model enhancements and their anticipated implementation timeframes.

8.2.1 Improve Regional Travel Representation (Near-Term)

The analysis demonstrates the importance of regional travel in shaping VMT and transportation system performance. Future model updates should enhance representation of inter-county and pass-through travel by refining the model area and external station assumptions, updating origin–destination patterns, and coordinating travel demand assumptions with neighboring regional models. These improvements would support more accurate estimation of corridor performance and VMT impacts associated with future growth and transportation investments.

8.2.2 Expand Beyond Peak Commute Travel (Mid-Term)

Model features should be enhanced to better reflect travel activity throughout the day. Potential improvements include refining time-of-day factors, updating trip purpose segmentation, and improving representation of midday, evening, and weekend travel patterns. These enhancements would increase model sensitivity to travel behavior changes and provide a more comprehensive representation of overall travel demand.

8.2.3 Strengthen Local Calibration (Mid-Term)

The study provides a valuable source of observed travel data, including traffic count, as well as travel data derived from big data sources such as Replica, that can be used to improve calibration and validation of the travel demand forecasting model. This data provides insights into travel volumes, trip patterns, trip lengths, and inter-county travel behavior that can be used to evaluate model performance and identify areas for improvement. Future updates should consider refining trip generation and trip distribution assumptions, improving corridor-level calibration, and updating land use inputs to reflect current development conditions and forecasts. Improved calibration will help

ensure that model forecasts are consistent with observed travel behavior and local transportation conditions and provide greater confidence in model applications for planning and project analysis.

8.2.4 Improve VMT and Policy Sensitivity (Long-Term)

As transportation analysis increasingly focuses on VMT-based performance measures, models should be capable of distinguishing among different trip types and travel markets. Future updates should support separate tracking of intra-county, inter-county, and pass-through travel and provide robust tools for evaluating transportation and land use scenarios. These enhancements would improve the ability of agencies to conduct environmental review analyses and evaluate the effectiveness of transportation policies and investment strategies.

Appendix A: Demographic Profile

American Community Survey (ACS) 2019-2023 5-Year Data - San Benito County

Label (Grouping)	San Benito County, California!!Estimate	San Benito County, California!Percent
EMPLOYMENT STATUS		
Population 16 years and over	51,266	51,266
In labor force	34,250	66.80%
Civilian labor force	34,210	66.70%
Employed	32,172	62.80%
Unemployed	2,038	4.00%
Armed Forces	40	0.10%
Not in labor force	17,016	33.20%

Appendix B: Countywide Travel Behavior Data Summary

Table B-1. All Trip Distribution by Trip Type¹

Trip Type	Weekday Count	Weekend Count
Pass-Through	194,200	186,500
Intra-County	163,100	150,700
Inter-County Outbound	54,200	48,800
Inter-County Inbound	48,300	44,900

Notes:

1. Values are rounded to the nearest 10 when less than 1,000, and to the nearest 100 when 1,000 or greater.
Source: Replica, Fehr & Peers, 2026.

Table B-2. Weekday Total VMT by Mode and Trip Type¹

Mode	Pass-Through	Intra-County	Inter-County Inbound	Inter-County Outbound
Private Vehicle	16,076,900	300,300	1,175,100	847,600
Freight	1,010,000	35,300	92,900	329,400

Notes:

1. Values are rounded to the nearest 10 when less than 1,000, and to the nearest 100 when 1,000 or greater.
Source: Replica, Fehr & Peers, 2026.

Table B-3. Weekday Total VMT by Mode and Trip Type¹

Mode	Pass-Through	Intra-County	Inter-County Inbound	Inter-County Outbound
Private Vehicle	13,029,700	275,400	961,200	744,900
Freight	988,600	23,200	73,300	233,000

Notes:

1. Values are rounded to the nearest 10 when less than 1,000, and to the nearest 100 when 1,000 or greater.
Source: Replica, Fehr & Peers, 2026.

Table B-4. Weekday Average Trip Length (Mile) by Mode and Trip Type¹

Mode	Pass-Through	Intra-County	Inter-County
Private Vehicle	178.0	3.2	37.4
Freight	61.6	3.6	37.9

Notes:

1. Values are rounded to the nearest tenth.
Source: Replica, Fehr & Peers, 2026.

Table B-5. Weekend Average Trip Length (Mile) by Mode and Trip Type¹

Mode	Pass-Through	Intra-County	Inter-County
Private Vehicle	188.4	3.3	37.1
Freight	71.7	3.7	43.2

Notes:

1. Values are rounded to the nearest tenth.

Source: Replica, Fehr & Peers, 2026.

Table B-6. Weekday Intra-County Origin Destination Flow Patterns¹

Origin/Destination	Hollister	San Juan Bautista	Unincorporated North	Unincorporated South
Hollister	89,200	1,200	19,400	2,900
San Juan Bautista	1,300	1,800	1,100	250
Unincorporated North	20,300	1,300	17,300	990
Unincorporated South	3,000	260	1,000	1,700

Notes:

1. Values are rounded to the nearest 10 when less than 1,000, and to the nearest 100 when 1,000 or greater.

Source: Replica, Fehr & Peers, 2026.

Table B-7. Weekend Intra-County Origin Destination Flow Patterns¹

Origin/Destination	Hollister	San Juan Bautista	Unincorporated North	Unincorporated South
Hollister	83,800	1,400	18,200	2,900
San Juan Bautista	1,500	1,300	960	200
Unincorporated North	18,900	1,200	14,300	1,000
Unincorporated South	3,100	210	1,100	870

Notes:

1. Values are rounded to the nearest 10 when less than 1,000, and to the nearest 100 when 1,000 or greater.

Source: Replica, Fehr & Peers, 2026.

Table B-8. Weekday Outbound Inter-County Origin Destination Flow Patterns¹

Destination/Origin	Hollister	San Juan Bautista	Unincorporated North	Unincorporated South
Gilroy	7,900	750	5,500	400
Salinas and North Monterey County Cities	4,300	810	4,900	340
Morgan Hill	2,000	150	780	80
Watsonville	1,000	220	1,700	40
Other Santa Clara County Cities	6,300	270	2,600	260
Other Monterey County Cities	2,200	190	1,600	380
Merced County Cities	900	80	1,500	570
Other Santa Cruz County Cities	1,000	50	460	20
Out of State	100	10	140	90
Other ²	2,400	190	1,700	260

Notes:

1. Values are rounded to the nearest 10 when less than 1,000, and to the nearest 100 when 1,000 or greater.
2. Other cities within California that are not listed above.

Source: Replica, Fehr & Peers, 2026.

Table B-9. Weekend Outbound Inter-County Origin Destination Flow Patterns¹

Destination/Origin	Hollister	San Juan Bautista	Unincorporated North	Unincorporated South
Gilroy	8,400	830	5,000	500
Salinas and North Monterey County Cities	4,100	810	4,000	180
Morgan Hill	1,800	240	780	60
Watsonville	780	140	1,500	30
Other Santa Clara County Cities	5,500	180	2,300	180
Other Monterey County Cities	1,600	250	1,500	210

Appendix E: Traffic Count Data Summary

Comparison of Replica Data and Traffic Counts

This appendix summarizes how Replica vehicle volumes and mode shares compare with observed traffic counts.

Average Weekday and Weekend Daily Vehicle Volume

Vehicle classification counts were collected on Tuesdays, Wednesdays, Thursdays, Saturdays, and Sundays between March 3 and March 15, 2026, at 20 locations (see the Traffic Count Locations map on the previous page). Average weekday and weekend daily traffic volumes derived from the classification counts were compared with the Average Spring weekday and weekend volume estimates from Replica at the same locations.

Across the 20 vehicle classification count locations, Replica performs well on higher-volume, key corridors and tends to underestimate traffic on lower-volume facilities, particularly weekends.

On high volume roadways (weekday average daily traffic (ADT) > 10,000), Replica closely matches observed volumes, with differences of +7 percent on weekdays and -7 percent on weekends. Strong weekday performance is observed on several important corridors, including most of SR 25, San Felipe Road in central Hollister, and Shore Road.

On medium-volume roadways (ADT between 1,000 and 10,000 vehicles), Replica generally underestimates volumes by approximately 20 percent to 35 percent on weekdays and 35 percent to 40 percent on weekends. These differences are driven in part by substantial underestimation on Fairview Road (approximately 50 percent to 60 percent) and Frazier Lake Road, where Replica underestimates volumes by approximately 90 percent. In contrast to Replica outputs, observed counts show relatively balanced northbound and southbound daily volumes, suggesting that travel patterns may be more bidirectional than represented in the model.

On low-volume roadways (ADT < 1,000), Replica generally underestimates volumes (-34 percent on weekdays and -64 percent on weekends). Results in this category are strongly influenced by the two Pinnacles entrance locations; excluding these locations improves the results to approximately -22 percent to -36 percent.

AM and PM Peak Period Mode Share

Mode share counts were collected during peak periods (7:00–11:00 AM and 3:00–7:00 PM) on one weekday and one weekend day at five locations between March 3 and March 15, 2026 (see the Traffic Count Locations map on the previous page). AM and PM peak-period mode shares derived from the counts were compared with the Average Spring weekday and weekend mode share estimates from Replica at the same locations.

At the 5 mode share count locations, Replica underestimates driver trips while overestimating passenger, Transportation Network Companies (TNC), and freight trips. When driver and passenger trips are combined, Replica aligns well with observed counts during the weekday AM and weekend

PM periods. Larger differences during the weekday PM and weekend AM periods appear to be driven primarily overestimated weekend freight activity.

Mode Share Comparison

Notes

- Heavy (counts) is assumed to be synonymous with Freight (Replica). Assumed to be single occupancy
- Buses are ignored from the counts, since they wouldn't show up in Replica
- Time periods in Replica are based on trip start time.

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5527 -- English (ENU)**Datasets:**

Site: [1] SR25 N OF SHORE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5528 -- English (ENU)**Datasets:**

Site: [1] SR25 N OF SHORE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: South (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Class Report

CustomList-5574 -- English (ENU)**Datasets:**

Site: [2] FRAZIER LAKE RD BT BLOOMFIELD AVE AND SHORE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5529 -- English (ENU)**Datasets:**

Site: [3] SAN FELIPE RD BT SR152 AND SHORE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5530 -- English (ENU)**Datasets:**

Site: [3] SAN FELIPE RD BT SR152 AND SHORE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: South (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5532 -- English (ENU)**Datasets:**

Site: [5] 4TH ST BT SAN BENITO ST AND MONTEREY ST
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: East (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5531 -- English (ENU)**Datasets:**

Site: [5] 4TH ST BT SAN BENITO ST AND MONTEREY ST
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: West (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA Class Report

CustomList-5533 -- English (ENU)**Datasets:**

Site: [7] SR25 BT SUNSET DR AND SOUTHSIDE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Class Report

CustomList-5534 -- English (ENU)**Datasets:**

Site: [7] SR25 BT SUNSET DR AND SOUTHSIDE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: South (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5536 -- English (ENU)**Datasets:**

Site: [8] AIRLINE HWY W OF FAIRVIEW RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: East (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5535 -- English (ENU)**Datasets:**

Site: [8] AIRLINE HWY W OF FAIRVIEW RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: West (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA Class Report

CustomList-5538 -- English (ENU)**Datasets:**

Site: [9] SR156B W OF GRAF RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13

Speed range: 0 - 100 mph.

Direction: East (bound), P = East, Lane = 0-16

Name: TDS

Scheme: Vehicle classification (Scheme F)

Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)

1 [Total] Number in time step

2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5537 -- English (ENU)**Datasets:**

Site: [9] SR156B W OF GRAF RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: West (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA Class Report

CustomList-5539 -- English (ENU)**Datasets:**

Site: [10] THE ALAMEDA BT 4TH ST AND NYLAND DR
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA Class Report

CustomList-5577 -- English (ENU)**Datasets:**

Site: [11] SR129 BT OLD CHITTENDEN RD AND CHITTENDEN RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: West (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5541 -- English (ENU)**Datasets:**

Site: [12] SAN JUAN GRADE RD N OF SAN JUAN CANYON RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5544 -- English (ENU)**Datasets:**

Site: [13] SR146 N OF STONEWALL CANYON RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: South (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5547 -- English (ENU)**Datasets:**

Site: [15] BITTERWATER RD N OF SAN LORENZO CREEK
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Class Report

CustomList-5548 -- English (ENU)**Datasets:**

Site: [15] BITTERWATER RD N OF SAN LORENZO CREEK
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: South (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

Traffic Data Service -- San Jose, CA Class Report

CustomList-5552 -- English (ENU)Datasets:

Site: [17] SR25 BT SR156 AND FLYNN RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: South (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5549 -- English (ENU)**Datasets:**

Site: [16] SR25 N OF LONOAK RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Class Report

CustomList-5553 -- English (ENU)**Datasets:**

Site: [18] SHORE RD W OF FRAZIER LAKE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: West (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5556 -- English (ENU)**Datasets:**

Site: [19] FAIRVIEW RD BT SR156 AND SAN FELIPE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13

Speed range: 0 - 100 mph.

Direction: East (bound), P = East, Lane = 0-16

Name: TDS

Scheme: Vehicle classification (Scheme F)

Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)

1 [Total] Number in time step

2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Traffic Data Service -- San Jose, CA

Class Report

CustomList-5555 -- English (ENU)**Datasets:**

Site: [19] FAIRVIEW RD BT SR156 AND SAN FELIPE RD
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: West (bound), P = East, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**

Class Report

CustomList-5557 -- English (ENU)**Datasets:**

Site: [20] FAIRVIEW RD N OF AIRLINE HWY
Data type: Axle sensors - Paired (Class/Speed/Count)

Profile:

Included classes: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13
Speed range: 0 - 100 mph.
Direction: North (bound), P = North, Lane = 0-16
Name: TDS
Scheme: Vehicle classification (Scheme F)
Units: Non metric (ft, mi, ft/s, mph, lb, ton)

Column Legend:

0 [Time] 24-hour time (0000 - 2359)
1 [Total] Number in time step
2 [Cls] Class totals

*** Tuesday, March 3, 2026**
